

**2023 ANNUAL GROUNDWATER  
MONITORING REPORT  
WESTSIDE BASIN  
SAN FRANCISCO AND SAN MATEO COUNTIES,  
CALIFORNIA**

**Prepared By:  
San Francisco Public Utilities Commission**

**In Cooperation with the City of Daly City, the City of San Bruno, and the  
California Water Service Company (South San Francisco District)**

**June 2024**

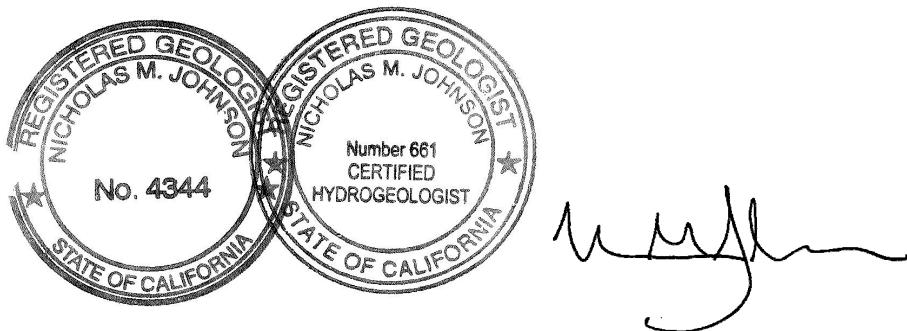

Services of the San Francisco Public Utilities Commission

June 13, 2024

## ACKNOWLEDGEMENTS

The Westside Basin Annual Groundwater Monitoring Report for 2023 was prepared by the San Francisco Public Utilities Commission in cooperation with the City of Daly City, the City of San Bruno, and the California Water Service Company (South San Francisco District). This report summarizes the results of water level elevation monitoring, general groundwater quality sampling and analysis, and additional groundwater-related field activities conducted within the Westside Basin in 2023.

## **EXECUTIVE SUMMARY**

This report presents the results of the 2023 groundwater monitoring program for the Westside Groundwater Basin (Westside Basin or Basin) in San Francisco and San Mateo counties, California. The San Francisco Public Utilities Commission (SFPUC) prepared this report in cooperation with its partner agencies the City of Daly City (Daly City), the City of San Bruno (San Bruno), and the California Water Service Company (Cal Water).

The Westside Basin designated by the California Department of Water Resources has an onshore area of approximately 40 square miles extending from Golden Gate Park in San Francisco to the City of Burlingame in San Mateo County. The Basin is an important source of municipal and irrigation water supply for the communities and businesses that overlie it. The North Westside Basin refers to the portion of the Basin in San Francisco and the South Westside Basin refers to the portion of the Basin in San Mateo County.

As classified by the United States Drought Monitor, the San Francisco Peninsula experienced “severe drought,” “moderate drought, and “abnormally dry” conditions from January through March 2023 (USDA, 2023). The San Francisco Peninsula did not experience dry or drought conditions for the remainder of the 2023 CY (USDA, 2023). Precipitation at the San Francisco Downtown gauge was 33.87 inches during water year (WY) 2023 (October 2022 through September 2023) and 27.59 inches for calendar year (CY) 2023 (years cited in the remainder of this report are CYs unless specified as WYs). The average annual precipitation at this station for the preceding 30 years, 1993-2022, is 22.89 inches (NOAA, 2023).

During 2023, SFPUC measured and recorded groundwater levels in 101 monitoring wells throughout the Westside Basin. Measurements were taken quarterly in 33 wells, semi-annually in 5 wells, and continuously in 63 wells using pressure transducers and data loggers. Additionally, SFPUC and the partner agencies conducted water quality sampling in 71 monitoring wells in the spring and fall and at 13 production wells in the spring.

The Regional Groundwater Storage and Recovery (GSR) Project began a second storage period July 1, 2023, following a two-year hold period from July 2021 through June 2023 and the first storage period from May 2016 through June 2021. At the end of 2023 the project’s partner agencies had received a total of 32,935 acre-feet of SFPUC surface water in-lieu of groundwater pumping from the Westside Basin.

Based on a combination of metered and estimated pumping, total groundwater pumping from the Westside Basin was approximately 6,123 acre-feet in 2023, a 23 percent decrease compared to 2022, and 98 percent of the annual average of 6,246 acre-feet for the preceding 10 years (2013-2022).

2023 was the sixth year of the San Francisco Groundwater Supply (SFGW) Project, although municipal groundwater pumping in the North Westside Basin remained low at less than 100 acre-feet. Municipal pumping decreased in the South Westside Basin by 42 percent in 2023 compared to 2022 as a result of the start of a second GSR storage period. Daly City and San Bruno municipal pumping was typical prior to the start of the second GSR storage period. Cal Water had limited ability to pump groundwater during 2023 while its upgraded treatment plant continued to operate at a low level.

Recycled water from the North San Mateo County Sanitation District was largely unavailable for golf course irrigation during 2023 due to system shut down and maintenance. Total recycled water use at the Lake Merced Golf Club, Olympic Club, and San Francisco Golf Club was 135 acre-feet in 2023, significantly lower than an average of 564 acre-feet during 2009-2018 when recycled water was more fully available. Corresponding with the below-average use of recycled water, groundwater use by Lake Merced area golf courses in 2023 was about 350 percent of their average use during 2009-2018.

Groundwater levels in North Westside Basin monitoring wells were generally stable during 2023. In the South Westside Basin, annual high and low groundwater levels in the Primary Production Aquifer generally increased in 2023 compared to 2022.

To manage Lake Merced water levels, SFPUC continues to work with local stakeholders and regulatory agencies to implement a multi-pronged approach. The interim target lake level is 14 to 16 feet North American Vertical Datum of 1988 (NAVD88). During 2023 the seasonal low and high water-level elevations of Lake Merced's South Lake were 16.78 and 18.48 feet NAVD88, about 9 percent higher than 2022 and above the range of interim target lake levels.

Groundwater monitoring continues to provide no definitive indication of saltwater intrusion in the Westside Basin other than in proximity to San Francisco Bay. Monitoring wells near the bay at San Francisco Airport and in Burlingame continue to encounter sub-sea level groundwater elevations and elevated and/or increasing chloride concentrations in some zones.

## **1.0 INTRODUCTION**

This report presents the results of the 2023 annual groundwater monitoring program for the Westside Groundwater Basin (Westside Basin or Basin) in San Francisco and San Mateo counties, California. The San Francisco Public Utilities Commission (SFPUC) prepared this report in cooperation with the City of Daly City (Daly City), the City of San Bruno (San Bruno), and the California Water Service Company (Cal Water).

The Westside Basin extends from Golden Gate Park within the City and County of San Francisco (San Francisco) to the City of Burlingame in San Mateo County. The California Department of Water Resources (DWR) designates it as California basin number 2-35. The Basin provides an important supply of municipal and irrigation water for the communities and businesses that overlie it. The northern and southern portions of the Westside Basin on either side of the San Francisco–San Mateo county line are referred to as the North and South Westside Basins, respectively (Figure 1).

Annual monitoring of the Westside Basin began in 2000 coordinated by the San Mateo County Environmental Health Services Agency (SMCEHSA, 2000). In 2004, SFPUC assumed implementation of the monitoring program in coordination with Daly City, San Bruno, and Cal Water. The monitoring program addresses planning elements in the 2005 *Final Draft North Westside Groundwater Basin Management Plan* (SFPUC, 2005) and the *South Westside Basin Groundwater Management Plan* (San Bruno and others, 2012).

In 2006, SFPUC prepared the report *Hydrogeologic Conditions in the Westside Basin–2005* (Luhdorff and Scalmanini Consulting Engineers [LSCE], 2006) in cooperation with Daly City, San Bruno, and Cal Water. It summarized the basin hydrogeology and provided an overview of historical, current, and planned activities related to groundwater as of 2005. Since 2007, the SFPUC Water Resources Division has prepared the Westside Basin annual groundwater monitoring report.

This annual report summarizes 2023 groundwater levels, pumping, and water quality within the Westside Basin in relation to the historical record. Additionally, it provides the water level record for Lake Merced in relation to groundwater conditions. The report is intended for public education and as a resource for SFPUC and cooperating agencies. The 2023 Westside Basin annual groundwater monitoring report can be accessed at:

<https://sfpuc.org/programs/water-supply-planning/groundwater>

SFPUC, Daly City, San Bruno, and Cal Water plan to continue coordinating the execution and reporting of this comprehensive monitoring program.

Unless stated otherwise, elevations provided in this document are in reference to the North American Vertical Datum of 1988 (NAVD88), which is locally 3.2 feet above mean sea level. San Francisco City Datum (SFCD) is equivalent to an elevation of 11.37 feet NAVD88. References to “sea level” in this document refer to zero elevation NAVD88.

Annual data presented herein are for calendar years (CYs) unless specified as water years (WYs). WY 2023, for example, was October 1, 2022 to September 30, 2023. Water years are useful for parsing wet and dry seasons whereas calendar years are useful for bracketing the typically spring-to-autumn period of relatively high-water demand and groundwater pumping for irrigation. Drought periods are typically defined in water years.

## **1.1 Planned and Ongoing Projects**

The following projects are in progress or being planned concurrently with the groundwater monitoring program.

### **San Francisco Groundwater Supply Project**

The SFPUC San Francisco Groundwater Supply (SFGW) project provides a new, local source of water for San Francisco that improves water supply reliability during local and regional system maintenance, drought, and emergencies. When fully implemented, the SFGW Project will provide up to 4 million gallons per day (mgd), on average, from wells in the North Westside Basin. Groundwater produced from the SFGW wells is blended with water from SFPUC’s Regional Water System before entering the municipal drinking water system.

Phase I test wells were constructed between 2007 and 2011 at the South and West Sunset Playgrounds, the Lake Merced Pump Station, and the Central Pump Station in Golden Gate Park. The project’s Final Environmental Impact Report (EIR) was certified in December 2013 and SFPUC approved the project for completion and implementation in January 2014.

Construction of pump stations for the four Phase I wells began in March 2015. Municipal groundwater production from the Lake Merced Pump Station well began in 2017 and from the South and West Sunset wells in early 2018. Production from the Golden Gate Park Central Pump Station well for park irrigation also began in early 2018. Production from the South and West Sunset wells was suspended following the detection in mid-2018 and mid-2021, respectively, of an industrial solvent in the raw groundwater. SFPUC is evaluating treatment options.

Phase II of the SFGW project began in late 2017 and involved rehabilitating two existing irrigation wells in Golden Gate Park and reconstructing their pump stations. Work on the North Lake well station was completed in March 2019 and work on the South Windmill well was completed in July 2020. The Phase II wells are being used for Golden Gate Park irrigation until

completion of the Westside Recycled Water Project in 2027 at which time, they will be connected to the local municipal drinking water system.

### **Recycled Water Projects**

The Harding Park Recycled Water Project was completed in the fall of 2012. The project uses recycled water from the North San Mateo County Sanitation District (NSMCSD), a subsidiary of Daly City, to irrigate Harding Park and Fleming golf courses in San Francisco. SFPUC partnered with NSMCSD to construct a new pump station, distribution piping, and storage tank. The project replaces the use of potable water from SFPUC's Regional Water System for golf course irrigation.

NSMCSD also supplies recycled water to three other golf courses near Lake Merced: Lake Merced Golf Club, Olympic Club, and San Francisco Golf Club.

The Westside Recycled Water Project includes the construction of a new recycled water treatment plant, storage reservoir, pump station, and associated pipelines to replace surface water and groundwater currently used to irrigate Golden Gate Park and Lincoln Park Golf Course in the Lobos basin. The EIR for the project was completed and certified in September 2015. Construction of the recycled water pipeline began in early 2017 and was completed in July 2018. Construction of the treatment facility began in late 2017, and pump station construction began in mid-2019. Recycled water system start-up testing is anticipated for 2025 with fully energized operations anticipated by late 2026.

Plans are under way to supply the San Francisco Zoo and the cemeteries in Colma with recycled water for irrigation in place of groundwater. In addition, SFPUC is currently evaluating feasibility of utilizing excess recycled water produced during off-peak irrigation periods to augment Lake Merced levels.

### **Regional Groundwater Storage and Recovery Project**

In cooperation with its partner agencies Daly City, San Bruno, and Cal Water, SFPUC is establishing a dry-year groundwater supply for its Regional Water System through implementation of the Regional Groundwater Storage and Recovery (GSR) Project in the South Westside Basin. The partner agencies currently supply potable water to their retail customers through a combination of groundwater pumped from the South Westside Basin and surface water purchased from SFPUC. The GSR Project will provide supplemental SFPUC surface water to the partner agencies during normal and wet years. During these years, the partner agencies will reduce their groundwater pumping by a comparable amount, increasing the amount of groundwater retained in storage (referred to as "in-lieu recharge").

During a period of normal and wet years, the volume of groundwater in the South Westside Basin will increase due to natural recharge and reduced groundwater pumping by the partner

agencies, increasing storage by up to 61,000 acre-feet (af) (about 20 billion gallons). During a period of dry or drought years, SFPUC's GSR project wells will pump the stored groundwater while partner agency wells will withdraw their agreed-upon portion of the basin yield as needed to supplement other supplies. This new water supply will increase the Regional Water System's available water supply during a multi-year drought.

The 2002-2005 Pilot In-Lieu Recharge Demonstration Program evaluated the feasibility of GSR in the South Westside Basin and indicated that GSR could be a viable dry-year water supply project (LSCE, 2005).

The GSR Project was approved in 2014, began construction in spring 2015, has completed initial startup, testing, and commissioning, with full completion anticipated in 2026. In addition, a new capital improvement project, "The Regional Groundwater Treatment Project," is evaluating centralized treatment options for some GSR wells. The GSR project delivered in-lieu water to the partner agencies during an initial 5-year storage period from May 2016 through June 2021. The partner agencies resumed pumping groundwater up to their individual designated quantities during a 2-year hold period from July 2021 through June 2023. The project began delivering in-lieu water during a second storage period beginning July 2023. At the end of 2023 the project's partner agencies had received a total of 32,935 acre-feet of SFPUC surface water in-lieu of groundwater pumping from the Westside Basin. Minor amounts of groundwater pumping from GSR wells have occurred during start-up testing and monthly maintenance.

### **Westside Basin Groundwater-Flow Model**

Development of the Westside Basin Groundwater Flow Model began in 2002 with funding from a California State Assembly Bill 303 grant (Daly City, 2003). Subsequent model updates and improvements have been funded by SFPUC and the partner agencies for the GSR Project (HydroFocus, 2007, 2009, 2011, 2017). SFPUC and the partner agencies have used the model to evaluate potential changes in groundwater conditions as a result of future activities and management practices. Model simulations supported the EIRs for the SFGW and GSR projects (Kennedy-Jenks, 2012). More recently the model was used to evaluate the expected performance of the GSR project (SFPUC, 2021). The model will continue to be updated and refined as new data are collected, analyzed, and incorporated into the Basin's hydrogeologic conceptual model and computer model calibration data set.

### **South Westside Basin Groundwater Management Plan**

The 2012 *South Westside Basin Groundwater Management Plan* (GMP) provides a framework for regional groundwater management that sustains the beneficial uses of the groundwater resource in the South Westside Basin (San Bruno and others, 2012). Development of the plan was led by San Bruno and funded by a grant from DWR. The plan's objectives include informing the public of the importance, challenges, and opportunities of groundwater

management in the South Westside Basin and developing consensus among stakeholders on issues and solutions related to groundwater. Additionally, the plan's objectives include building relationships among stakeholders within the South Westside Basin and local and state agencies and supporting programs and actions to ensure the long-term sustainability of the groundwater resource. The plan provides recommendations for managing groundwater levels, protecting groundwater quality, and avoiding land surface subsidence.

### **North Westside Basin Groundwater Management Plan**

SFPUC developed draft groundwater management plans for the North Westside Basin in 2005 and 2016. The recent plan was developed to guide implementation of the SFGW Project and sustainably manage the groundwater resource within the northern portion of the Basin. The plan summarizes the Basin hydrogeology, defines measurable objectives and actions for avoiding saltwater intrusion, land subsidence, and impacts to interconnected surface water, while protecting groundwater yield and quality. The plan also provides for public outreach, stakeholder involvement, and coordination with the management of the South Westside Basin. A draft plan was completed in 2016 and an update will be completed in 2025. Because DWR classified the Westside Basin as very low priority in 2019, submission of a Westside Basin groundwater sustainability plan to DWR is not currently required under the 2014 California Sustainable Groundwater Management Act (SGMA).

### **1.2 Municipal Water Agencies**

Approximately 2.7 million people rely on water supplied by SFPUC to meet their daily water needs. SFPUC is the retail water supplier for domestic, commercial, and institutional customers in San Francisco, which includes the North Westside Basin, and for numerous retail accounts outside the city. In addition, SFPUC provides water to 27 wholesale customers in San Mateo, Alameda, and Santa Clara counties under contractual agreement. Approximately two-thirds of the SFPUC water supply are delivered to the wholesale customers and one-third is delivered to retail customers.

The SFPUC Regional Water System draws approximately 85% of its water from runoff collected in Hetch Hetchy Reservoir in the upper Tuolumne River watershed within Yosemite National Park. This water is conveyed by gravity to Bay Area reservoirs and water users through a 167-mile aqueduct. The remainder of the water supply is derived from local runoff collected in reservoirs in the Alameda Creek and Peninsula watersheds in Alameda and San Mateo counties.

Water supply systems within the South Westside Basin are operated and managed by the Daly City Department of Water and Wastewater Resources, the Water Division of the San Bruno Public Services Department, and Cal Water (an investor-owned water utility) for South San

Francisco District that includes South San Francisco, Colma, and a small portion of Daly City. These systems are supplied by groundwater pumped from the South Westside Basin and contracted water deliveries from the SFPUC Regional Water System. Since the 1990s, SFPUC and its partner agencies in the South Westside Basin have worked cooperatively to monitor and manage groundwater and coordinate projects.

### **1.3 California Groundwater Elevation Monitoring Program**

DWR established the California Statewide Groundwater Elevation Monitoring Program (CASGEM) in 2009 in accordance with Senate Bill X7-6. It requires designated responsible parties to monitor seasonal groundwater elevations in basins within their jurisdiction and submit these data to DWR. SFPUC is the designated CASGEM entity for monitoring and reporting groundwater elevations in the North Westside Basin and six other small groundwater basins within San Francisco: Lobos, Marina, Downtown San Francisco, Islais Valley, South San Francisco, and Visitacion Valley. The potential groundwater supply from the six small basins is relatively minor and currently unused other than springs in Lobos Basin that supply water for the Presidio.

SFPUC measured groundwater levels in CASGEM monitoring wells in the North Westside Basin during in spring and fall 2023 and the Islais Valley Basin in fall 2023. Consisting of Daly City, San Bruno, and Cal Water, the South Westside Basin Voluntary Cooperative Groundwater Monitoring Association (SWBVCGMA) monitors CASGEM wells in the South Westside Basin.

## **2.0 WESTSIDE BASIN CLIMATE, HYDROLOGY, AND HYDROGEOLOGY**

### **2.1 Climate**

San Francisco has a Mediterranean climate with cool dry summers and mild wet winters. Based on meteorological data collected between 1914 and 2015, San Francisco's annual average daily high and low air temperatures are approximately 64- and 51-degrees Fahrenheit (°F), respectively. Temperatures range seasonally from a monthly average daily low of about 45°F in December and January to a monthly average daily high of about 70°F in September and October.

Since the early 1900s, San Francisco's mean annual precipitation has been approximately 21 inches, nearly all of which occurs as rainfall. On average, about 85% of annual precipitation occurs between November and March. December, January, and February are the wettest months, with rainfall averaging approximately four inches per month. May through September are the driest months, with average monthly rainfall of less than one-half inch.

Portions of the Westside Basin near the Pacific Ocean have a distinct maritime Mediterranean climate influenced by wind, fog, and precipitation. In summer and fall, locations adjacent to the ocean, such as Lake Merced, are often foggy with cool temperatures in the 50s and 60s °F.

As classified by the United States Drought Monitor, the San Francisco Peninsula experienced “severe drought,” “moderate drought, and “abnormally dry” conditions from January through March 2023 (USDA, 2023). The San Francisco Peninsula did not experience dry or drought conditions for the remainder of the 2023 CY (USDA, 2023). Following three years of below average precipitation during WYs 2020-2022, the San Francisco Downtown gauge recorded 33.87 inches during WY 2023 (October 2022 through September 2023) and 27.59 inches for CY 2023. The average annual precipitation at this station for the preceding 30 years (CYs 1993-2022) is 22.89 inches (NOAA, 2023).

### **2.2 Hydrogeology**

The Westside Basin has a land surface area of approximately 40 square miles in San Francisco and San Mateo counties (Figure 1). DWR designates it as California groundwater basin number 2-35. The Westside Basin borders five other groundwater basins: the Lobos Basin to the north (DWR basin 2-38); the Downtown, Islais Valley, and Visitacion Valley groundwater basins to the east (basins 2-40, 2-33, and 2-32); and the San Mateo Plain subbasin of the Santa Clara Valley basin to the south (basin 2-9.03).

As defined by Phillips and others (1993), the Westside Basin's northern boundary extends approximately four miles inland from Lands End north of Ocean Beach in San Francisco along a

mostly buried bedrock ridge north and through Golden Gate Park. Continuing clockwise around the Basin, its northeastern boundary encompasses the panhandle of Golden Gate Park and extends five miles south through Twin Peaks and Mount Davidson to the San Francisco-San Mateo county line about a mile east of Lake Merced. The eastern Basin boundary continues south into San Mateo County, extending six miles along the southern flank of San Bruno Mountain to San Francisco Bay, and then five miles along the bay shore from South San Francisco to Burlingame. A buried bedrock ridge and a thick accumulation of Bay Mud appears to separate the basin from San Francisco Bay in the San Bruno area. The 1.6-mile southeastern boundary is defined by a bedrock high separating the Westside Basin from the San Mateo Plain Subbasin. The Basin's southwestern boundary follows the Serra Fault zone from Hillsborough twelve miles northwest to the Pacific Ocean. The Basin's onshore western boundary follows the coast for about six miles from Daly City north along Ocean Beach. The Basin may extend west offshore until reaching low-permeability zones associated with deformation along one or more branches of the San Andreas fault. The 2.2-mile county-line boundary between the North and South Westside basins does not have any hydrogeological significance other than influencing the distribution of municipal groundwater pumping.

The Westside Basin contains two primary water-bearing geologic units, the weakly consolidated upper Merced Formation and the younger unconsolidated Colma Formation. These generally sandy units are underlain and bounded by the structurally deformed middle and lower units of the Merced Formation and low-permeability basement rock consisting primarily of the Franciscan Complex. Surficial units include dune sands, alluvium along existing and former stream channels, hillslope deposits, and both engineered and non-engineered artificial fill. These surficial deposits may directly overlie basement rock in hillslope areas of the Basin. The total thickness of the basin's water-bearing units ranges from about 300 feet near Golden Gate Park to 700 feet or more in portions of the South Westside Basin (Figure 2).

Three aquifer zones are recognized in the Westside Basin, the Shallow, Primary Production, and Deep aquifers (LSCE, 2010). The Shallow Aquifer extends 50 to 120 feet below the water table within surficial deposits and the Colma and upper Merced formations. This shallow water-table zone occurs above the "-100-foot clay" and other clayey aquitards beneath portions of the Sunset District and Lake Merced areas. A shallow water-table zone is less well defined in the South Westside Basin due to predominantly fine-grained deposits at shallow depths and the partial dewatering of shallow zones.

The roughly 300-foot thick Primary Production Aquifer occurs within the upper Merced Formation below the -100-foot clay aquitard (where present) and above the W-clay aquitard, or its equivalent, from the Sunset District through Daly City to Colma. The Primary Production Aquifer is subdivided vertically by discontinuous aquitards, including the X- and Y-clays extending between the Sunset District and Daly City, and an aquitard that separates shallow

and deep aquifer zones beneath South San Francisco. The Primary Production Aquifer becomes overlain by fine-grained Bay Sediments southeast of South San Francisco.

The Deep Aquifer is up to 200 feet thick and occurs within the upper Merced Formation beneath the W-clay, or its equivalent, from the Sunset District to Colma.

Groundwater in the vicinity of Lake Merced and north to Golden Gate Park is encountered at relatively shallow depths, ranging from approximately 5 to 60 feet below ground surface (bgs). Lake Merced is incised into the Colma Formation and is in hydraulic continuity with the Shallow Aquifer. Within the pumping depressions of the South Westside Basin, depths to groundwater within the Primary Production and Deep aquifers can exceed 250 feet bgs. Groundwater movement is restricted along the southwestern boundary of the South Westside Basin by a low-permeability boundary formed along the Serra Fault zone.

## **2.3 Surface Water Hydrology**

### **Lake Merced**

Until the early 1900s, Lake Merced was a natural lake fed by local runoff and springflow and drained by a stream discharging from the northwestern end of the lake. The stream flowed to the ocean through the present-day location of the San Francisco Zoo and Sloat Boulevard. The springs were primarily along the eastern side and beneath the southern portion of the lake, resulting in primarily south-to-north flow through the lake.

Today, Lake Merced consists of four lakes (North, East, South, and Impound lakes) and has no channelized inflow or outflow. A narrow channel connects North Lake and East Lake and equalizes their water surface elevations. A conduit between North Lake and South Lake allows water to flow between the lakes when the elevation in either lake is at least approximately 3.35 feet SFCD (14.72 feet NAVD88). When lake levels are below that elevation, these two lakes are separated and typically exhibit different water surface elevations. South Lake and Impound Lake are separated below an elevation of approximately 4.26 feet SFCD (15.63 feet NAVD88) by a levee that contains the Ingleside combined sewer pipeline and serves as the foundation of an elevated pedestrian walkway. Water flows freely beneath the pedestrian walkway and connects both lakes when the level of either lake is above this elevation. Under current and recent conditions, the flow of water through the four lakes is generally north to south.

Beginning with the construction of the Vista Grande Canal and Tunnel by Spring Valley Water Works in 1897, urbanization of the Lake Merced watershed has diverted storm runoff away from the lake to help maintain the lake's water quality. Additionally, urbanization has impeded springflow into the lake as a result of emplaced fill, reduced groundwater recharge to the Shallow Aquifer, and downward hydraulic gradients caused by pumping from the underlying

aquifers. As a result, lake levels have become more sensitive to seasonal and climatic variability.

### **Pine Lake**

Pine Lake (also known as Laguna Puerca) is a relatively shallow, 3.4-acre freshwater lake located in the westernmost portion of Stern Grove and Pine Lake Park, about 0.5-mile northeast of Lake Merced. Pine Lake is one of San Francisco's few natural lakes. Similar to Lake Merced, Pine Lake is incised into the upper portion of the Shallow Aquifer.

The San Francisco Recreation & Parks Department (SFRPD) completed an improvement program for Stern Grove and Pine Lake Park in 2007. Since then, lake levels have been maintained at about 31.5 feet SFCD (42.9 feet NAVD88) by augmenting the lake with groundwater pumped from the previously inactive Stern Grove well approximately 1,500 feet east of Pine Lake. According to SFRPD staff, the lake level is maintained by pumping groundwater into the lake for 2 to 3 days in the summer and 1 day in winter. As a result, the recent average lake level is about 4 feet higher than in 2007 and about 7 feet higher than in 2004, with a typical depth of about 11.5 feet.

### **Golden Gate Park Lakes**

Golden Gate Park has 13 small lakes and ponds that were constructed or substantially altered by the park's development. Five of the lakes (Elk Glen, Middle, South, Mallard, and North lakes) are believed to have been natural and fed by groundwater, whereas the other lakes and ponds may or may not have coincided with pre-existing natural surface water features. The lake levels are currently maintained by groundwater pumped from SFGW project wells until deliveries from the Westside Recycled Water Project begin.

### **3.0 HISTORICAL AND RECENT GROUNDWATER USE**

Groundwater pumped from the Westside Basin has been used as a water supply since at least the early 1900s (Bartell, 1913a). Table 1 and Figure 3 summarize the historical record of municipal groundwater pumping from the Westside Basin since 1949. Table 2 and Figure 4 summarize the record of groundwater pumping for park, golf course, and cemetery irrigation. A brief summary of municipal and irrigation water use follows.

#### **San Francisco**

By the early 1900s, wells drilled to the north, east, and south of Lake Merced were supplying irrigation and potable water pumped from the Westside Basin. The Spring Valley Water Company operated two wells near the outlet of Lake Merced that pumped about 0.1 mgd, or about 100 acre-feet per year (afy) (Bartell, 1913b). Total groundwater pumping from the Lake Merced area, the Sunset District, and Golden Gate Park averaged about 0.4 mgd (400 to 500 afy). In addition, approximately 3 mgd were diverted from spring-fed Lake Merced for potable and emergency use until 1932.

During the early 1930s the San Francisco Board of Public Works installed production wells with a combined capacity of about 6.5 mgd (7,300 afy) in the Sunset District to serve as a drought emergency water supply (San Francisco Water Department [SFWD], 1994). These wells produced an average of 5 mgd (5,600 afy) between 1930 and 1935. Use of these wells ended once Tuolumne River water from Hetch Hetchy Reservoir became available to San Francisco in the mid-1930s (SFWD, 1961).

As described in Section 1.1, SFPUC installed four new municipal water supply wells from 2007 to 2011 as part of the SFGW Project, and in 2020 completed the retrofit of two Golden Gate Park irrigation wells for either irrigation or municipal potable use. Production from the Lake Merced well began in 2017; production from the South Sunset, West Sunset, and Golden Gate Central wells began in 2018; and production from the South Windmill and North Lake wells began in 2021. The SFGW Project contributed approximately 48 af (0.04 mgd) to the municipal water supply in 2023. The three SFGW wells in Golden Gate Park will continue to provide about 1.2 mgd for park irrigation until a reliable recycled water supply is available.

#### **Daly City Service Area**

Local groundwater use by Daly City increased from about 1,500 afy in 1950 to 5,000 afy in 1970 coinciding with post-war development (Kirker, Chapman & Associates, 1972). Between 1970 and 2014, Daly City's groundwater use ranged from approximately 3,000 to 5,000 afy, except during the 2002-2005 Pilot In-Lieu Recharge Demonstration Program (Section 1.1) when pumping was reduced to approximately 700 to 2,700 afy. Daly City pumping declined

substantially during the initial (2016-2021) and current (since July 2023) GSR project storage periods as a result of SFPUC in-lieu surface water deliveries. During the GSR project hold period from July 2021 through June 2023, Daly City resumed pumping up to its designated quantity of 2.2 mgd (reduced provisionally from 3.43 mgd because of treatment limitations). Daly City currently has the following six production wells, although not all operated in 2023: Jefferson, Junipero Serra, Sullivan, Vale, DC-4, and Westlake. Daly City produced 1,478 af (1.32 mgd) of groundwater for municipal use in 2023.

### **South San Francisco District**

Municipal groundwater pumping by Cal Water for its South San Francisco District declined from about 2,200 afy in the 1950s to approximately 1,100 afy in 2002 (Figure 3). From 2003 to 2008, groundwater pumping in South San Francisco was temporarily discontinued as part of the Pilot In-Lieu Recharge Demonstration Program, during which SFPUC surface water supplies temporarily replaced the use of groundwater. From 2008 to 2015, groundwater pumping by Cal Water for South San Francisco steadily increased from approximately 200 to 1,300 afy. Cal Water groundwater pumping declined substantially during the initial (2016-2021) and current (since July 2023) GSR storage periods as a result of SFPUC in-lieu surface water deliveries. During the GSR project hold period from July 2021 through June 2023, Cal Water had sufficient well capacity to pump up to its designated quantity of 1.37 mgd but was unable to do so due to a treatment plant upgrade. Cal Water currently has six production wells, SS-19 through SS-24. Cal Water produced 199 af (0.18 mgd) of groundwater for municipal use in South San Francisco in 2023.

### **San Bruno Service Area**

Municipal groundwater pumping by San Bruno was approximately 2,000 afy from the 1950s through the mid-1980s, then varied between 1,000 and 3,000 afy through 2002 (Figure 3). From 2002 to 2005, San Bruno reduced its pumping to approximately 550 to 1,200 afy during the Pilot In-Lieu Recharge Demonstration Program, after which its pumping ranged between approximately 1,600 to 2,400 afy through 2015. San Bruno's groundwater pumping declined substantially during the initial (2016-2021) and current (since July 2023) GSR storage periods as a result of SFPUC in-lieu surface water deliveries. During the GSR project hold period from July 2021 through June 2023, San Bruno resumed pumping up to its designated quantity of 2.1 mgd. San Bruno currently has four production wells, SB-16, -17, -18, and -20, all of which operated in 2023. San Bruno produced 1,053 af (0.94 mgd) of groundwater for municipal use in 2023.

### **Irrigation and Other Non-Potable Use**

Westside Basin groundwater use for irrigation and other non-potable uses at Golden Gate Park, the San Francisco Zoo, Lake Merced area golf courses, and Colma cemeteries is summarized

below and in Tables 1 and 2 and Figure 4. The estimated annual groundwater use by each of these is discussed in Sections 4.6 through 4.9.

- **Golden Gate Park:** Golden Gate Park historically and currently uses groundwater pumped from wells within the park for irrigation and maintaining lake levels. Three wells constructed or refurbished by the SFGW project have supplied the park's water needs since 2019: South Windmill Replacement well, North Lake well, and Golden Gate Central well. These wells will be operated for potable use once recycled water is available for park use. Groundwater pumping for Golden Gate Park was 1,317 af (1.18 mgd) in 2023.
- **San Francisco Zoo:** The San Francisco Zoo historically and currently uses groundwater for irrigation and various zoo exhibits. Its groundwater pumping has been metered since 2005. The San Francisco Zoo well is operated and maintained by SFRPD. SFPUC regularly records the flowmeter readings from the well. The Zoo produced 166 af (0.15 mgd) of groundwater for its use in 2023. The SFPUC is constructing the Westside Recycled Water Treatment Facility at its Oceanside Wastewater Treatment Plant to deliver recycled water to various locations on the Westside of the City including the San Francisco Zoo. The San Francisco Zoo Recycled Water Project will construct a new recycled water pipeline and convert the Zoo's current groundwater supply and distribution system to recycled water. Supplying this demand with recycled water will offset close to 100% of Zoo's annual groundwater use and will conserve high quality groundwater to supplement potable water supplies in San Francisco.
- **Golf Courses:** There are seven golf courses in the Westside Basin that have used groundwater for irrigation: Harding Park Golf Course, Lake Merced Golf Club, Olympic Club Golf Course, San Francisco Golf Club, California Golf Club, Golden Gate Park Golf Course, and Green Hills Country Club. Following its completion in 2004, the NSMCSD Wastewater Treatment Plant began serving recycled water for irrigating three golf courses (Lake Merced Golf Club, Olympic Club Golf Course, and San Francisco Golf Club). In 2012, recycled water was made available to Harding Park from NSMCSD for irrigation. The Golden Gate Park Golf Course will begin receiving recycled water from the Westside Recycled Water Project beginning approximately fall 2026.

Metered groundwater pumping and recycled water use are reported by Lake Merced Golf Club, Olympic Club Golf Course, and San Francisco Golf Club (Table 2). The estimates of annual groundwater use presented in Table 2 and Figure 4 for the California Golf Club are from LSCE (2005) for 1960-2005, Carollo Engineers (2008) for 2006-2010, and HydroFocus (2011) for 2011-present. Groundwater pumping for golf course irrigation was approximately 997 af (0.89 mgd) in 2023 (excluding irrigation for the Golden Gate Park Golf Course, which is included with the park's total groundwater use).

- **Cemeteries:** The Westside Basin includes about 600 acres of cemetery property within and near Colma that historically and currently have pumped groundwater for irrigation. Estimates of cemetery annual groundwater use presented in Table 1 and Figure 4 are from LSCE (2005) for 1960-2005, Carollo Engineers (2008) for 2006-2010, and Hydro focus (2011) for 2011-present. Golden Gate National Cemetery has not been irrigated with groundwater since the 1960s (Boone, Cook and Associates, 1987). Total groundwater pumping for cemetery irrigation based on these estimates was approximately 859 af (0.77 mgd) in 2023.

## **4.0 2023 GROUNDWATER USE**

In 2023, groundwater pumping in the Westside Basin supplied municipal water for Daly City, South San Francisco (Cal Water), San Bruno, and San Francisco. Additionally, non-potable groundwater was pumped for irrigation and other uses by Golden Gate Park, Pine Lake, San Francisco Zoo, golf courses, and cemeteries. Westside Basin groundwater pumping is described below and summarized in Tables 1 and 2 and Figures 3 and 4.

### **4.1 City of Daly City**

Groundwater pumping by Daly City for municipal use during CY 2023 totaled 1,478 af (1.32 mgd).

### **4.2 California Water Service Company (South San Francisco District)**

Groundwater pumping by Cal Water for municipal use during CY 2023 totaled 199 af (0.18 mgd).

### **4.3 City of San Bruno**

Groundwater pumping by San Bruno for municipal use during CY 2023 totaled 1,053 af (0.94 mgd).

### **4.4 City and County of San Francisco**

Groundwater pumping by SFPUC for municipal use during CY 2023 totaled 48 af (0.04 mgd).

### **4.5 Regional Groundwater Storage and Recovery Project**

No groundwater pumping by the GSR project took place during CY 2023.

### **4.6 Golden Gate Park and Pine Lake**

Metered groundwater pumping for irrigation and other non-potable uses in Golden Gate Park during CY 2023 totaled 1,317 af (1.18 mgd).

In addition, SFRPD estimates that approximately 5 afy of groundwater pumping from the Stern Grove well is needed to maintain the level of Pine Lake.

### **4.7 San Francisco Zoo**

Metered groundwater pumping at the San Francisco Zoo during CY 2023 totaled 166 af (0.15 mgd).

#### **4.8 Golf Courses**

Metered groundwater pumping by Lake Merced Golf Club, Olympic Club Golf Course, and San Francisco Golf Club during CY 2023 totaled approximately 626 af (0.56 mgd) [Table 1 and 2]. Because of the limited availability of recycled water, groundwater pumping for Lake Merced area golf course irrigation in 2023 was more than 60 percent greater than 2022 and about 400 percent greater than when a sufficient supply of recycled water existed prior to 2018.

Groundwater pumping by California Golf Club and Green Hills Country Club is unmetered but estimated to average 237 and 134 afy (0.21 and 0.12 mgd), respectively (HydroFocus, 2011; Table 1).

Total groundwater use for irrigating Westside Basin golf courses in 2023 is estimated to be 997 af (0.89 mgd).

#### **4.9 Cemeteries**

Groundwater pumping for irrigating the Colma cemeteries is unmetered but estimated to average 859 afy (0.77 mgd) [HydroFocus, 2011; Table 1].

#### **4.10 Summary**

As summarized in Table 1, groundwater production from the Westside Basin totaled approximately 6,123 af (5.46 mgd) in 2023. Municipal groundwater use by San Francisco, Daly City, San Bruno, and California Water Service Company (South San Francisco) was 2,777 af (2.48 mgd) in 2023. The three metered golf clubs in the Lake Merced area used 626 af (0.56 mgd) of pumped groundwater and 135 af (0.12 mgd) of recycled water during 2023.

The total metered use of Westside Basin groundwater in 2023 was approximately 4,888 af (4.36 mgd). Metered usage includes municipal pumping for potable use by San Francisco, Daly City, San Bruno, and Cal Water (South San Francisco); and pumping for non-potable use by Golden Gate Park, San Francisco Zoo, Lake Merced Golf Club, Olympic Club Golf Course, and San Francisco Golf Club. Average annual non-metered groundwater pumping in the Westside Basin is estimated to be approximately 1,235 afy (1.10 mgd) [HydroFocus, 2011] and includes California Golf Club, Green Hills Country Club, Pine Lake filling, and cemeteries.

This report does not estimate groundwater pumping for domestic use, remediation, or construction dewatering. These uses may be assumed to be relatively small compared to most of the uses inventoried above.

### **5.0 MONITORING PROGRAM OVERVIEW**

The Westside Basin monitoring program consists of quarterly or more frequent groundwater and lake level gauging and annual, semi-annual (spring and fall), or more frequent groundwater

sampling for selected water quality parameters. These data support an ongoing evaluation of general groundwater conditions and water quality within the aquifer system, with particular emphasis on lake-aquifer interactions and the potential for saltwater intrusion. Program data extend back as far as 1996 and provide a baseline for evaluating the implementation of SFGW, GSR, and other projects.

The groundwater elevation monitoring network consists of 101 individual wells at 41 locations (Table 3, Figure 5). Four are inactive production wells and the remainder are dedicated monitoring wells. The monitored wells are subdivided into coastal, lake-aquifer, Bay side, and general North and South Westside Basin monitoring networks. Table 4 lists a subset of 44 of these wells used to construct groundwater elevation contour maps for the Shallow and Primary Production aquifers. As shown in Table 5, measurements are collected manually on a quarterly or semi-annual basis for some wells, and continually using electronic pressure transducers and data loggers for other wells. Groundwater elevation hydrographs relative to the NAVD88 datum are provided for selected wells in Figures 11 through 14 and 16 through 21, and for all monitored wells in Appendix A. The monitoring program also includes continuous monitoring of the water surface elevation of Lake Merced's South Lake using a pressure transducer installed in a stilling well.

The groundwater quality monitoring network consists of 87 individual wells at 42 locations (Table 6, Figure 6). All are dedicated monitoring wells except for 15 that are active or occasionally active production wells. These wells are subdivided into separate coastal, Bay side, and general basin monitoring networks. Samples are collected annually and semi-annually as indicated in Table 7. Recent and historical groundwater quality monitoring results are presented and discussed in Section 7. The laboratory analytical reports are provided in Appendix B.

SFPUC's Water Quality Division (WQD) has led the fieldwork for the groundwater quality monitoring program since fall 2014. WQD's sampling protocols and field procedures for this program are presented in the *Westside Basin Groundwater Monitoring Manual of Procedures* (SFPUC, 2014; Appendix C).

Samples collected to assess general groundwater quality are analyzed for some or all of the following constituents:

- General minerals: total alkalinity, calcium, magnesium, sodium, potassium, chloride, and sulfate.
- Nitrate.
- General parameters: specific conductance, pH, total dissolved solids (TDS), and hardness (as CaCO<sub>3</sub>).

## **6.0 GROUNDWATER AND LAKE LEVEL MONITORING**

Figures 7 and 8 present 2023 spring and fall estimated groundwater elevation contours for the Shallow Aquifer, and Figures 9 and 10 present 2023 spring and fall estimated groundwater elevation contours for the Primary Production Aquifer. The estimated groundwater elevation contours are based on 2023 groundwater level data for the monitoring wells listed in Table 4.

The following sections discuss the groundwater level monitoring results for the coastal, lake-aquifer, South Westside Basin, and Bay side monitoring networks.

### **6.1 Coastal Groundwater Level Monitoring**

The coastal groundwater level monitoring network consists of 26 individual wells at 11 locations along the coastal zone from Golden Gate Park south to Daly City (Table 3, Figure 5).

Monitoring well clusters are located in western Golden Gate Park; along the Old Great Highway near Kirkham, Ortega, and Taraval streets; and at San Francisco Zoo, Fort Funston, and Thornton Beach.

Figures 11, 12, 13, and 14 present groundwater elevation hydrographs for the period of record for the Kirkham, Ortega, Taraval, and Zoo monitoring well clusters, respectively. These plots include chloride concentrations monitored at these same wells as discussed in Section 7.1.

Groundwater elevations in both the Shallow and Primary Production Aquifer coastal monitoring wells were above sea level in 2023 except for monitoring well South Windmill MW140 which experienced an annual low groundwater level of -0.63 feet NAVD88.

Table 8 compares 2022 and 2023 annual low groundwater levels for selected coastal monitoring wells. Compared to 2022, annual low groundwater levels in the Shallow Aquifer were lower in 2023 at monitoring wells South Windmill MW57, South Windmill MW140, and Kirkham MW130. Annual low groundwater levels in the remaining Shallow Aquifer wells (monitoring wells Ortega MW125 and Taraval MW145) were higher in 2023 compared to 2022. Annual high groundwater levels in the Shallow Aquifer during 2023 were generally the same as in 2022.

Annual low groundwater levels in the Primary Production Aquifer were lower in 2023 compared to 2022 at monitoring wells Kirkham MW255, Kirkham MW385, Kirkham MW435, Ortega MW265, Ortega MW400, and Ortega MW475. Annual low groundwater levels in the remaining Primary Production Aquifer wells (monitoring wells Taraval MW240, Taraval MW400, Zoo MW275, and Zoo MW450) were higher in 2023 compared to 2022. Annual low groundwater levels monitored in the Deep Aquifer by Taraval MW530 (Figure 13d) and Zoo MW565 (Figure 14c) declined slightly from the prior year, although levels remain well above their 2013 annual lows. The 2013 annual low is used for comparison purposes because groundwater levels were at a 14-year low that year prior to the recent GSR storage period.

Groundwater elevations in monitoring wells SF-1 and SWM-3 remained above sea level during 2023 and were similar to the prior year (see hydrographs in Appendix A). Groundwater elevations in monitoring well South Windmill MW140 were slightly below sea level during the third quarter of 2023 but have now increased to above sea level as of the fourth quarter of 2023. Water level declines in these wells from 2020 to 2021 coincided with resumed pumping from the nearby South Windmill SFGW well beginning in June 2020 after 18 months of in-operation during refurbishment.

Groundwater elevations measured in monitoring wells at Fort Funston and Thornton Beach are generally stable and consistently above sea level (Appendix A). Groundwater conditions at these locations appear to be hydraulically separate from the Westside Basin to the east as a result of low permeability, deformed geologic strata along the Serra fault thrust zone (LSCE, 2004).

## **6.2 Lake Merced and Lake-Aquifer Level Monitoring**

The level of Lake Merced is monitored continuously at South Lake using a pressure transducer installed in a stilling well. Groundwater levels surrounding the lake complex are monitored with a network of 20 dedicated monitoring wells at 10 locations using a combination of continuous and periodic monitoring (Table 3, Figure 5).

SFPUC is working with local stakeholders and regulatory agencies to implement a multi-pronged approach to manage lake levels. This includes adding regional system water to stabilize lake levels, last done in 2005, and establishing an interim target lake level elevation range between 14 and 16 feet NAVD88.

Figure 15 presents the 1997-2023 lake level hydrograph for Lake Merced's South Lake. South Lake water surface elevations ranged from approximately 16.78 to 18.42 feet NAVD88 in 2023 and were above the established interim lake level range of 14 to 16 feet NAVD88. Seasonal high and low lake levels were higher in 2023 than 2022. The 2023 seasonal low level was approximately 5.5 feet above the 2002 seasonal low. The 2002 seasonal low is used for comparison because lake levels were then at a 24-year low prior to the GSR Pilot In-Lieu Recharge Demonstration Program and the availability of recycled water for irrigating Lake Merced Area golf courses. South and Impound lakes were interconnected during 2023 because the level of South Lake did not fall below 15.63 feet NAVD88 (4.26 feet SFCD).

Groundwater elevations in the Shallow Aquifer surrounding Lake Merced ranged from 17.29 feet NAVD88 in monitoring well LMMW-1S to 28.91 feet NAVD88 in LMMW-7SS during spring 2023. During fall 2023, groundwater elevations ranged from 16.49 feet NAVD88 in LMMW-1S to 28.36 feet NAVD88 in LMMW-7SS.

Groundwater elevations in the Primary Production Aquifer in the vicinity of Lake Merced ranged from 0.41 feet NAVD88 in monitoring well LMMW-3D to 15.83 feet NAVD88 in LMMW-2D during spring 2023. During fall 2023, groundwater elevations in the Primary Production Aquifer in the vicinity of Lake Merced ranged from -4.80 feet NAVD88 in LMMW-3D to 14.78 feet NAVD88 in LMMW-2D.

Figure 16 presents groundwater level hydrographs for a pair of monitoring wells near the western shore of South Lake, one screened in the Shallow Aquifer (LMMW-1S) and one in the Primary Production Aquifer (LMMW-1D). Groundwater levels measured in LMMW-1S during 2023 generally remained above levels recorded during the WY 2012-2015 drought. Groundwater elevations in LMMW-1D began a rising trend in 2016, surpassing high levels observed in 2011, then declined from 2019 through 2021 coinciding with increased local pumping. Recycled water was unavailable for irrigating Lake Merced area golf courses for much of 2023, resulting in increased local pumping and a downward influence on water levels. Water levels in both monitoring wells remain substantially above low levels measured in 2002, with recent recoveries following the start of a second GSR project storage period in July 2023.

Groundwater levels in the Primary Production Aquifer measured in monitoring well LMMW-3D near the southwestern shore of Impound Lake (see hydrograph in Appendix A) had been rising since 2016, coinciding with the start of the 2016-2021 GSR storage period. Seasonal highs at this location have exceeded sea level each year since 2017. A groundwater level decline began in 2019 and continued through 2021, coinciding with (a) increased pumping locally by golf courses while recycled water from NSMCSD was largely unavailable from approximately September 2019 to September 2020 and (b) the resumption of pumping by GSR partner agencies during the July 2021 to June 2023 GSR project hold period. Despite increased groundwater use for golf course irrigation in 2023, groundwater levels rose slightly as a result of the start of a second GSR storage period on July 1, 2023.

### **6.3 South Westside Basin Groundwater Level Monitoring**

The groundwater level monitoring network in the South Westside Basin consists of 53 wells at 19 locations along the Basin axis between Daly City and Burlingame (Table 3, Figure 5). One of these wells (LMMW-6D) also is included in the Lake-Aquifer monitoring network, and seven of these wells at three locations comprise the Bay side monitoring program described in Section 6.4.

Excluding wells in the Bay side program discussed below, this network consists of ten monitoring well clusters and one single monitoring well installed by SFPUC from 2007 to 2012 (Kennedy/Jenks, 2009, 2010a, 2012), and four inactive production wells (DC-1, DC-8, SS 1-02, and SB-12), located within Daly City, Colma, South San Francisco, San Bruno, and Millbrae. Monitoring records for nine of these wells extend back to 2000. Prior to fall 2015, the network

included an additional monitoring well cluster (CUP-3A) that was destroyed to accommodate the construction of a GSR production well.

Figures 17, 18, and 19 present groundwater level hydrographs for monitoring well DC-1 Westlake in Daly City, SS1-02 in South San Francisco, and SB-12 in San Bruno. Appendix A provides hydrographs for all network wells.

Groundwater levels in all South Westside Basin monitoring wells representative of the Primary Production Aquifer were below sea level in 2023, ranging from -8.13 (LMMW-6D) to -165.96 (SB-12 Elm Avenue) feet NAVD88 during the spring monitoring event, and from -14.44 feet to -160.50 feet NAVD88 for these same two wells during the fall monitoring event.

Annual high and low groundwater levels in the Primary Production Aquifer generally increased in 2023 compared to 2022 throughout the South Westside Basin, largely due to the start of a new GSR project storage period in July 2023.

Groundwater levels in shallower zones rose or were stable within the South Westside Basin.

#### **6.4 Bay Side Groundwater Level Monitoring**

San Bruno has conducted groundwater level monitoring since 2006 at two well clusters along the San Francisco Bay margin (Bay side) of the Westside Basin, one in the City of Burlingame (Burlingame-S, -M, and -D) and the other at San Francisco International Airport (SFO-S and SFO-D; Figure 5; WRIME, 2007a). San Bruno monitors these wells on a semi-annual basis in accordance with the *San Bruno Saltwater Intrusion Monitoring Wells: Sampling Plan* (WRIME, 2007b). Figures 20 and 21 present groundwater level hydrographs for the Burlingame and SFO monitoring well clusters, respectively.

In March 2023, groundwater elevations in the Burlingame-S, -M, and -D monitoring wells were 2.57, -0.47, and -5.86 feet NAVD88, respectively, and groundwater elevations in SFO-S and SFO-D were 2.56 and -26.12 feet NAVD88, respectively. In August 2023, groundwater elevations in Burlingame-S, -M, and -D were 2.37, -1.05, and -4.79 feet NAVD88, respectively, and groundwater elevations in SFO-S and SFO-D were 1.56 and -24.82 feet NAVD88, respectively. Consistent with previous years, 2023 groundwater levels in SFO-S were above sea level and levels in SFO-D were below sea level. Levels in SFO-D increased approximately 8 feet from 2016 to early 2021, before declining approximately 2 feet in late 2021, stabilizing in 2022, and increasing by approximately 2 feet in 2023. Levels in Burlingame-S and -M have fluctuated within 4 feet of sea level since the wells were installed in 2006. Levels in Burlingame-D have consistently been below sea level since installation and exhibit a gradual decline over the entirety of the dataset. In August 2021, the groundwater elevation in Burlingame-M and Burlingame-D reached all-time lows of -3.96 and -8.24 feet NAVD88, respectively, with levels recovering in 2023 to more typical elevations.

## **7.0 GROUNDWATER QUALITY MONITORING**

Wells included in the groundwater quality monitoring network are listed in Table 6 and located on the map in Figure 6. The network consists of 72 dedicated monitoring wells clustered at 27 locations and 15 production wells. These wells are subdivided into four separate groups: coastal; Sunset District and Lake Merced area; South Westside Basin; and San Francisco Bay margin (Bay side). Samples are typically collected annually and semi-annually as indicated in Table 7.

Water quality monitoring results for sampled raw (untreated) groundwater are presented in Tables 9 and 10 for the period of record in comparison to the maximum contaminant level (MCL) and secondary maximum contaminant levels (SMCL) of each water quality constituent or parameter, if established. Primary MCLs are regulatory benchmarks for drinking water developed to protect human health. SMCLs are benchmarks developed to protect the aesthetic quality of drinking water (e.g., taste, odor, and appearance). Although the monitoring well water quality results are compared to drinking water standards, many of the monitoring wells are not representative of the locations or depths of existing potable production wells. Furthermore, much of the groundwater produced for potable use is blended with surface water prior to being distributed. Laboratory analytical reports are provided in Appendix B.

### **7.1 Coastal Groundwater Quality Monitoring**

The coastal groundwater quality monitoring network consists of 21 wells at 9 locations along the coastal zone from Golden Gate Park south to San Francisco Zoo (Table 6, Figure 6).

Monitoring well clusters are located in western Golden Gate Park; along the Old Great Highway near Kirkham, Ortega, and Taraval streets; and at the San Francisco Zoo. The network is configured to detect indications of potential saltwater intrusion along the Pacific Ocean coast. Groundwater samples from these wells are analyzed for specific conductance, TDS, and chloride. Table 9 presents groundwater quality monitoring results for the coastal network. Measured chloride concentrations are plotted on the groundwater level hydrographs provided in Figures 11 through 16.

In 2023, chloride concentrations in groundwater samples collected from the coastal monitoring wells were below the recommended SMCL of 250 milligrams per liter (mg/L) and ranged from 22.8 mg/L for monitoring well Ortega MW400 to 220 mg/L for USGS South Windmill MW57. Chloride concentrations tend to be inversely correlated with depth (higher concentrations in wells screened in shallow zones of the aquifer and lower concentrations in wells screened in deep zones of the aquifer). For example, chloride concentrations in the Kirkham, Ortega, and Taraval monitoring well clusters were as follows:

- Coastal monitoring wells screened between 100 and 140 feet bgs (Kirkham MW255, Ortega MW125, and Taraval MW145) had chloride concentrations between 30.9 mg/L and 43.1 mg/L.
- Coastal monitoring wells screened between 180 and 260 feet bgs (Kirkham MW255, Ortega MW265, and Taraval MW240) had chloride concentrations between 25.1 mg/L and 39.7 mg/L.
- Coastal monitoring wells screened between 330 and 390 feet bgs (Kirkham MW385, Ortega MW400, and Taraval MW400) had chloride concentrations between 22.8 mg/L and 37.4 mg/L.
- Coastal monitoring wells screened between 420 and 520 feet bgs (Kirkham MW435, Ortega MW475, and Taraval MW530) had chloride concentrations between 23.7 mg/L and 29.9 mg/L.

Chloride and TDS concentrations and values of specific conductance for the coastal monitoring wells were generally within historical ranges during 2023.

## **7.2 Sunset District and Lake Merced Area Groundwater Quality Monitoring**

The groundwater quality monitoring network in the Sunset District and Lake Merced area consists of 7 individual wells at 4 separate locations (Table 6, Figure 6). Groundwater samples from these wells are analyzed for total alkalinity, pH, specific conductance, TDS, hardness, calcium, magnesium, sodium, potassium, chloride, sulfate, and nitrate (as nitrate). Table 10 presents historical and recent groundwater quality monitoring results for these wells.

Groundwater chloride concentrations have been elevated in samples from monitoring well LMMW-1S since the well was first sampled in 2009. The spring and fall 2023 samples had chloride concentrations of 175 and 574 mg/L, respectively. The fall result was the highest chloride concentration measured for this well since 2009 and exceeded the recommended SMCL of 250 mg/L.

Groundwater sampled from LMMW-1S have fluctuated above and below the MCL of 45 mg/L for nitrate (as nitrate) since monitoring began in 2004. In 2023 concentrations were 32.1 and 150 mg/L for the spring and fall samples, respectively; the fall result was a new maximum concentration for this well. Groundwater sampled from LMMW-1D has fluctuated above and below the MCL for nitrate (as nitrate) since 2010; 2023 concentrations were 42.9 mg/L and 41.6 mg/L in the spring and fall samples, respectively.

Among the remaining wells in this group, 2023 chloride concentrations ranged between 42 mg/L (West Sunset Playground monitoring well, spring) and 266 mg/L (LMMW-2S, spring) with concentrations in the latter well exceeding the recommended SMCL of 250 mg/L. Nitrate (as

nitrate) concentrations were below the MCL and ranged from below the laboratory detection limit (West Sunset Playground monitoring well, LMMW-3S, and LMMW-3D, spring and fall) to 31.9 mg/L (LMMW-2S, spring).

### **7.3 South Westside Basin Groundwater Quality Monitoring**

The groundwater quality monitoring network in the South Westside Basin consists of 59 wells at 29 locations, 15 of which are active or occasionally active production wells (Table 6, Figure 6). Records for the dedicated monitoring wells extend back to the years they were installed, 2003-2012, whereas some production well records extend back to the mid-1970s for Daly City, the late 1950s for Cal Water, and 2000 for San Bruno. Table 10 presents historical and current groundwater quality monitoring results for these wells. Groundwater samples from these wells are analyzed for total alkalinity, pH, specific conductance, TDS, hardness, calcium, magnesium, sodium, potassium, chloride, sulfate, and nitrate (as nitrate).

Five wells at two locations comprise the Bay side monitoring program and are discussed separately in Section 7.3.5. Groundwater samples from these wells are analyzed for total alkalinity, pH, specific conductance, TDS, hardness, calcium, magnesium, sodium, potassium, chloride, sulfate, nitrate (as nitrate), bromide, boron, and orthophosphate.

During 2023, chloride concentrations in groundwater sampled from the South Westside Basin (excluding the Bay side monitoring wells) were below the recommended SMCL and ranged from 35.9 mg/L (MW-M1, spring) to 214 mg/L (CUP-31A MW595, spring). TDS concentrations ranged from 230 mg/L (Park Plaza MW620, fall) to a maximum of 1,090 mg/L (CUP-44-1 MW580, fall), above the recommended SMCL of 500 mg/L. Nitrate (as nitrate) concentrations in groundwater exceeded the MCL of 45 mg/L in samples collected from monitoring wells Park Plaza MW195 and CUP-23 MW600 and ranged from below the laboratory detection limit to 93 mg/L (CUP-23 MW600, fall). Figure 22 is a plot of nitrate concentrations for six production wells monitored in the South Westside Basin.

The following sections discuss the results of groundwater quality monitoring in the Daly City, Colma, South San Francisco, San Bruno, and Millbrae areas.

#### **7.3.1 Daly City**

During 2023, detected concentrations of nitrate (as nitrate) in groundwater sampled from wells in the Daly City area ranged from below the laboratory detection limit to 54.9 mg/L for well Park Plaza MW195 (spring, Table 10), above the MCL of 45 mg/L.

Figure 23 presents time-series plots of chloride and TDS concentrations and specific conductance in groundwater sampled from the DC-2 Westlake production well. TDS concentrations were generally above the recommended SMCL of 500 mg/L in samples collected from 2001-2014, after which they were below the SMCL through 2021, before recently climbing

above the SMCL from 2022-2023. Chloride concentrations ranged from 52.1 mg/L (DC-Junipero Serra, spring) to 188 mg/L (CUP-10A-MW710, spring), below the recommended SMCL of 250 mg/L. Production wells DC-4 and Vale were out of service in 2023 and could not be sampled.

### **7.3.2 Colma**

Groundwater pumped in the Colma area is used for cemetery irrigation. Currently, groundwater is not pumped for municipal use in Colma. As part of the proposed GSR project, monitoring well clusters CUP-18 and CUP-19 were installed in the Colma area. During 2023, TDS concentrations ranged between 403 mg/L (CUP-19 MW475, spring) and 605 mg/L (CUP-18 MW595, fall). Chloride concentrations ranged from 94.7 mg/L (CUP-19 MW690, fall) to 152 mg/L (CUP-18 MW595, fall), below the recommended SMCL of 250 mg/L. Detected nitrate (as nitrate) concentrations were below the primary MCL of 45 mg/L and ranged from 5.2 mg/L (CUP-19 MW475, spring) to 28.8 mg/L (CUP-19 MW690, spring and fall) (Table 10).

### **7.3.3 South San Francisco**

During 2023, wells sampled in the South San Francisco area had TDS concentrations ranging from 230 mg/L (CUP-23 MW440, spring) to 959 mg/L (CUP-31 MW595, fall), with 15 of 25 wells above the recommended SMCL of 500 mg/L during the spring event, and with 10 of 19 wells above the recommended SMCL during the fall event. Chloride concentrations ranged from 36.8 mg/L (CUP-31A MW480, fall) to 214 mg/L (CUP-31A MW595, spring), and were below the recommended SMCL of 250 mg/L (Table 10). Detected nitrate (as nitrate) concentrations ranged from 0.69 mg/L (CUP-23 MW440, spring) to 93 mg/L (CUP-23 MW600, fall), which exceeds the MCL of 45 mg/L. Groundwater sampled from CUP-23 MW600 first exceeded the MCL for nitrate in 2015 and continued to do so through 2023.

Figure 24 presents time-series plots of chloride, TDS, and specific conductance for groundwater sampled from Cal Water well SS1-21. TDS concentrations and specific conductance have consistently exceeded the recommended SMCLs.

### **7.3.4 San Bruno and Millbrae**

During 2023, groundwater quality in the San Bruno and Millbrae areas was monitored in the CUP-44-1 nested well group, monitoring well MW-M1, and four San Bruno production wells (SB-16, -17, -18, and -20). TDS concentrations ranged from 248 mg/L (MW-M1, fall) to 1,090 mg/L (CUP-44-1 MW580, fall), with each of the four CUP-44-1 nested wells (MW190, MW300, MW460, and MW580) above the recommended SMCL of 500 mg/L (spring and fall). Detected chloride concentrations were below the recommended SMCL of 250 mg/L and ranged from 35.9 mg/L (MW-M1, fall) to 197 mg/L (CUP-44-1 MW580, spring). Detected nitrate (as nitrate) concentrations were below the primary MCL of 45 mg/L and ranged from 0.09 mg/L (SB-16, spring) to 6.22 mg/L (CUP-44-1 MW190, spring).

Figure 25 presents a time-series plot for San Bruno production well SB-20 (Lions Field Park). Chloride, TDS, and specific conductance have been consistently below their respective SMCLs in this well since 2004.

### 7.3.5 Bay Side

As part of the City of San Bruno's Bay side monitoring program, the SFO and Burlingame well clusters were sampled in March and August 2023 (Table 10). Figures 20 and 21 provide plots of 2023 and historical chloride concentrations for the Burlingame and SFO wells superimposed on their respective 2006-2023 groundwater level hydrographs.

During the 2023 sampling events, chloride concentrations exceeded the upper SMCL of 500 mg/L in groundwater samples from Bay side monitoring wells SFO-S (11,000 mg/L spring and 10,000 mg/L fall), SFO-D (1,200 mg/L spring and 1,300 mg/L fall), and Burlingame-S (1,200 mg/L spring and 1,100 mg/L fall). Chloride concentrations at Burlingame-M (30 mg/L spring and 34 mg/l fall) and Burlingame-D (180 mg/L spring and 46 mg/L fall) were below the recommended SMCL of 250 mg/L. Nitrate (as nitrate) was detected in groundwater samples from monitoring well Burlingame-M at concentrations below the MCL (0.52 mg/L spring and 0.50 mg/L fall). Nitrate was not detected in the remaining Bay side monitoring wells sampled in either the spring or fall of 2023.

## **8.0 SUMMARY OF PROPOSED ACTIVITIES FOR 2024**

### **8.1 Groundwater Monitoring Program**

In 2024, SFPUC, in cooperation with its partner agencies, will assess general groundwater conditions throughout the Westside Basin through continued implementation of the groundwater monitoring and reporting program documented in this report. This program remains consistent with recommendations made in the report on hydrogeologic conditions in 2005 (LSCE, 2006) and will continue to be updated and evaluated.

### **8.2 Coastal Groundwater Monitoring**

SFPUC will ensure groundwater measurements are recorded daily to quarterly (Table 5) and conduct semi-annual (spring and fall) sampling of coastal groundwater quality (TDS, specific conductance, and chloride; Table 7).

### **8.3 Lake Merced**

SFPUC will continue the Lake Merced groundwater and lake-level monitoring program in accordance with the recommendations of the 2005 annual report. Groundwater measurements will be recorded daily to quarterly, consistent with the current program (Table 5).

### **8.4 CASGEM**

SFPUC and the South Westside Basin Voluntary Cooperative Groundwater Monitoring Association (SWBVCGMA) will continue to participate in the CASGEM Program. SFPUC will continue collecting groundwater elevations for the North Westside Basin and reporting these data to DWR. SWBVCGMA will continue collecting South Westside Basin groundwater elevations and reporting these data to DWR.

### **8.5 General Basin Conditions and GSR Project**

SFPUC will continue to monitor water levels and general water quality of key wells in the Westside Basin (Tables 5 and 7). The general water quality and water level monitoring network will document the Basin's response to initial testing and operation of the GSR project.

### **8.6 Bay Side Monitoring**

The City of San Bruno will continue to monitor its Bay side monitoring wells in the southeastern portion of the Westside Basin on a semi-annual basis, in general accordance with the Westside Basin monitoring program, and transmit these data to SFPUC for inclusion in the annual groundwater monitoring report.

## Table 9

### Coastal Monitoring Network Groundwater Quality

#### Notes

<sup>a</sup> = Anomalous primary sample results in 2018 were replaced with the corresponding duplicate result where available, as these results more closely resembled the historical concentrations.

= Shaded cell indicates data collected in 2023

<sup>\*</sup> = Anomalous or questionable result

<sup>\*\*</sup> = Nitrate as NO<sub>3</sub> is a calculated value: [NO<sub>3</sub>] = 4.4 x [Nitrate as N]; for these results, Laboratory reported Nitrate as Nitrogen rather than Nitrate as Nitrate concentration.

Beginning in the Spring of 2016, the lab began reporting all Nitrate results as Nitrate as Nitrogen, and therefore from this point forward all results have been corrected and are no longer being marked by an \*\*.

-- = Not analyzed

mg/L = Milligrams per liter

µmhos/cm = Micromhos per centimeter

# = **Bold** font indicates a result that exceeds an MCL

NE = Not established

MCL<sup>1</sup> =Maximum Contaminant Level; values for MCLs are provided where they have been established for particular constituents. MCLs are drinking water standards that public water systems must achieve. They are not intended to regulate groundwater from monitoring wells or untreated water from production wells, because after withdrawal groundwater may be disinfected, filtered, blended, exposed to the atmosphere, and/or otherwise treated before being delivered to consumers. However, MCLs are used for comparison in this report to provide context for evaluating the quality of untreated groundwater. Primary MCLs are regulatory benchmarks for protecting human health. Secondary MCLs are benchmarks to protect the aesthetic quality of drinking water and are based on effects such as taste, odor, or appearance.

Secondary MCL<sup>2</sup> = 250/500/600: Recommended/Upper/Short Term

**General Basin Groundwater Quality**

**Notes**

<sup>a</sup> = Duplicate result used as the primary sample was inadvertently not analyzed for the indicated parameter.

<sup>b</sup> = Beginning in the Spring of 2016, the lab began reporting all Nitrate results as Nitrate as Nitrogen. All data presented herein are presented as Nitrate as NO<sub>3</sub>. Where Nitrate as

NO<sub>3</sub> is a calculated value: [NO<sub>3</sub>] = 4.4 x [Nitrate as N].

= Shaded cell indicates data collected in 2023

mg/L = milligrams per liter

µmhos/cm = Micromhos per centimeter

-- = Not analyzed

ND = Non-detectable concentration. Detection limit not known.

\* = Anomalous or questionable result

# = **Bold** font indicates a result that exceeds the maximum contaminant level (MCL) and/or the secondary maximum contaminant level (SMCL)

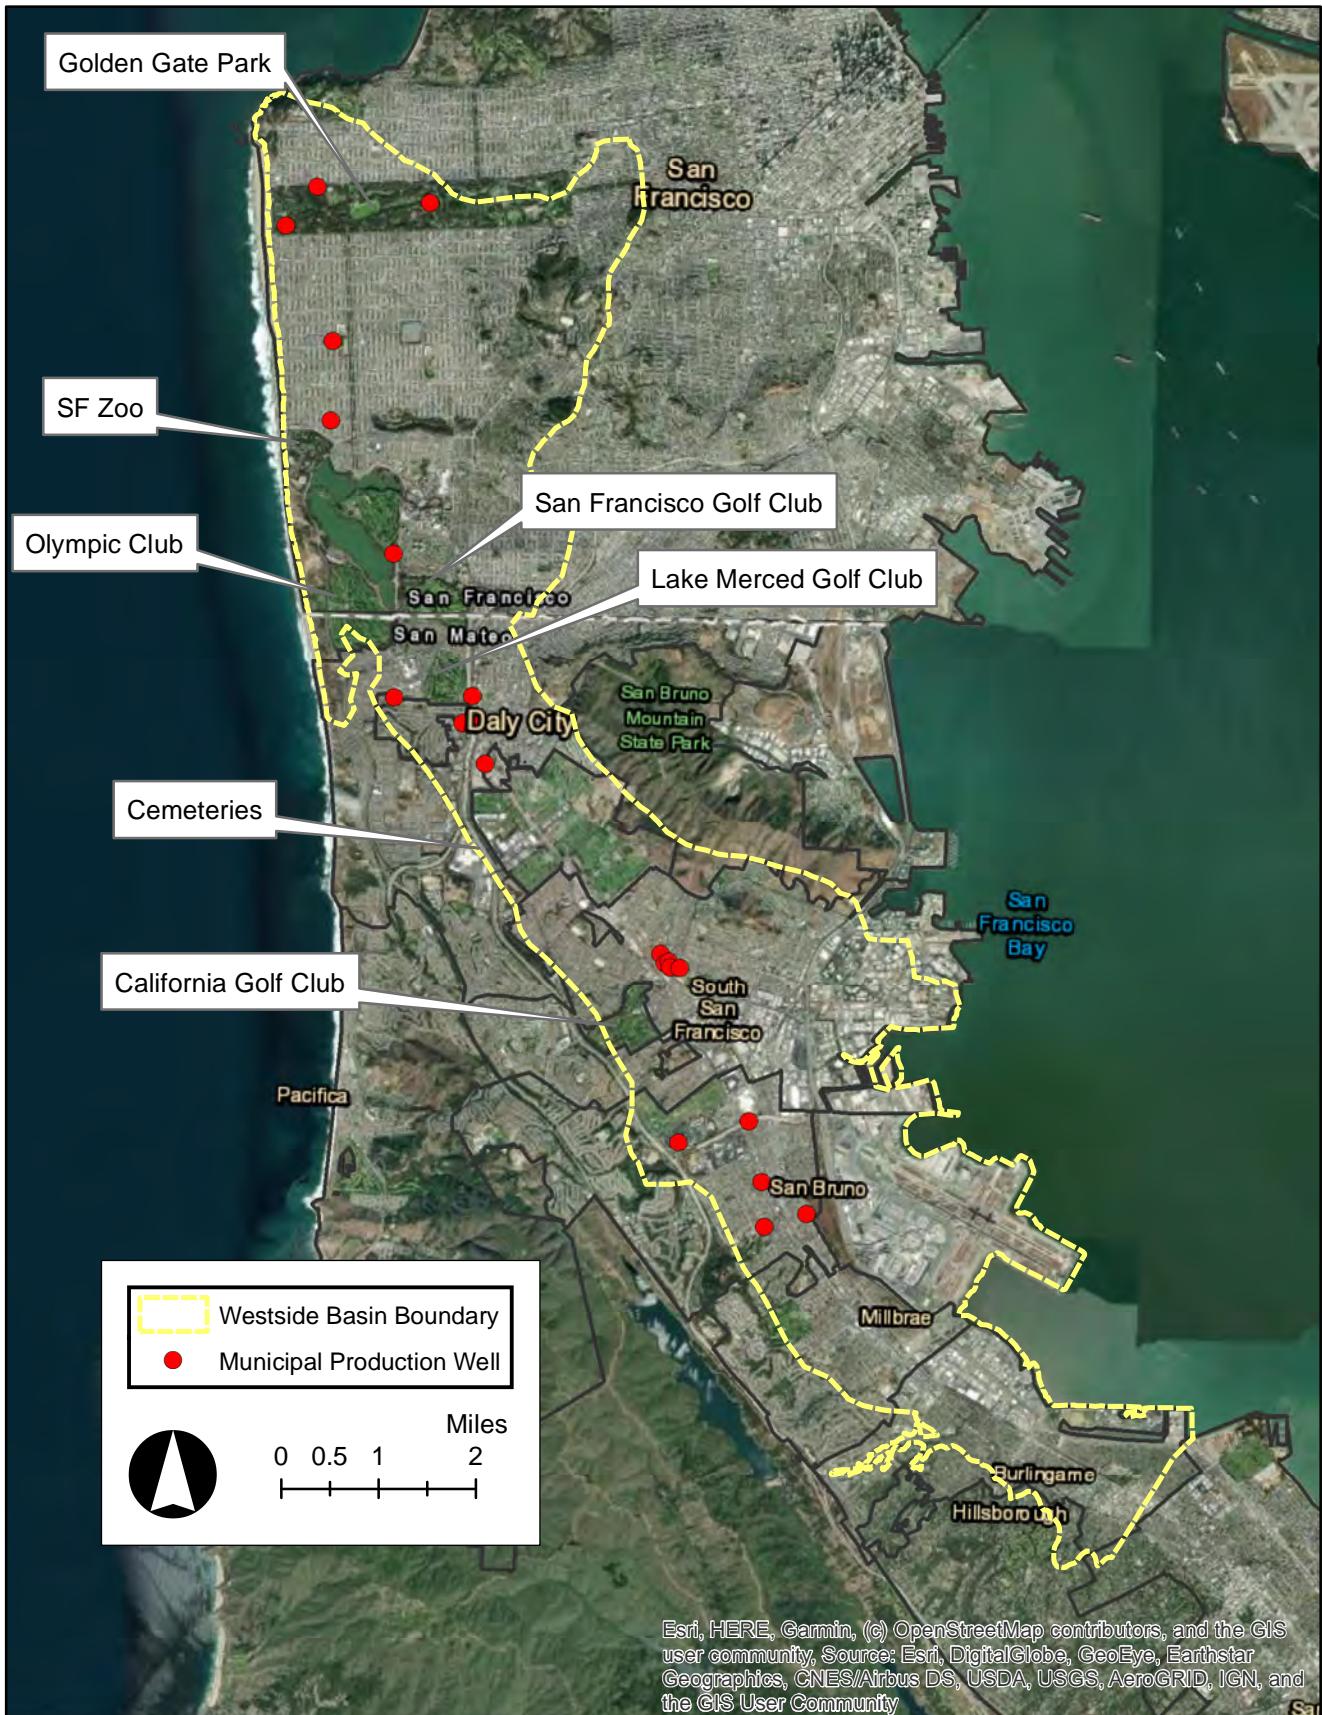

NE = Not established

MCL<sup>1</sup> = Maximum Contaminant Level; values for MCLs are provided where they have been established for particular constituents. MCLs are drinking water standards that public water systems must achieve. They are not intended to regulate groundwater from monitoring wells or untreated water from production wells, because after withdrawal groundwater may be disinfected, filtered, blended, exposed to the atmosphere, and/or otherwise treated before being delivered to consumers. However, MCLs are used for comparison in this report to provide context for evaluating the quality of untreated groundwater. Primary MCLs are regulatory benchmarks for protecting human health. Secondary MCLs are benchmarks to protect the aesthetic quality of drinking water and are based on effects such as taste, odor, or appearance.

Secondary MCL<sup>2</sup> = 250/500/600: Recommended/Upper/Short Term

## Water Quality Laboratory

FOLDER ID: 2303267

Client: SF\_PUC\_PLANNING

Project: WESTSIDE\_BASIN

Routine: WSB\_SFPUC+Consult.A

Scheduled Sample Date: 05/16/2023

Sampling Team: Field

### Qualifiers Legend:

#### Flag

Code	Description
B1	Target analyte detected in associated Method Blank.
B2	Target analyte detected in Travel/Trip Blank.
D	Result taken from the analysis of a dilution.
E1	Estimated value. Exceeds calibration range. Reanalysis not possible due to insufficient sample vol.
E2	Estimated value. Exceeds calibration range. Reanalysis not performed due to hold time requirement.
E3	EMPC (estimated maximum possible concentration)
H1	Sample analysis performed past the method specified hold time per client request.
H2	Initial analysis within hold time. Reanalysis for the required dilution was past hold time.
H3	Sample was received past hold time.
H4	Confirmatory analysis was past hold time.
H5	Confirmatory analysis was past hold time. Original result not confirmed.
H6	Filtration not completed within method specific time; Filtered in Lab. Filtration exceeded hold time.
I1	I.S. recovery or R.T. outside method limits. Interference confirmed by reanalysis/dilution. GC/GCMS
L1	LCS and/or LCSD is outside acceptance limits. Results might be low biased.
L2	LCS and/or LCSD is outside acceptance limits. Results might be high biased.
M	Matrix interference suspected.
M1	MS/MSD % rec. outside acceptable limits. Batch acceptance by LCS.
M2	MS/MSD RPD outside acceptable limits. Batch acceptance by LCS.
M3	Sample diluted due to matrix. MS recovery not useful. Batch acceptance by LCS.
NA	Not Analyzed
NC	Not for Compliance
NC1	Method specification(s) not met
NC2	Test/analyte is not accredited or accreditation is not available.
NP	Not provided
NS	Not sampled (or no sample received)
P1	Sample received and analyzed without chemical preservation.
P2	Sample received without chemical preservation but preserved by the laboratory.
P3	Sample received with inadequate chemical preservation, but preserved by the laboratory
P4	Sample was received outside recommended temperature range.
P5	Sample received in inappropriate sample container.
P6	Insufficient sample received to meet method requirements.
P7	Sample received with head space.
Q	%RPD between the 1st and 2nd column/detector is >40%. Lower value reported.
Q1	Minimum Reporting Limit (MRL) verification failed high, but target analyte was not detected.
R	Data rejected
S	Dilution due to sample matrix effects, the surrogate recovery was outside the acceptance limits.
S1	Sample diluted due to matrix. Surrogate spike recovery provides no useful information.
S2	Surrogate recovery below acceptable limits. Results might be low biased.
S3	Surrogate recovery exceeds acceptable limits. Results might be high biased.
TIC	Tentatively Identified Compound
U	Analyzed but not detected

#### RQualifier

Code	Description
+	Positive
-	Negative

<	Less Than
=	Equals
>	Greater Than
A	Bacti result, absent
DNQ	Detected, but Not Quantified
E	Estimated value
I	Bacti result, Inconclusive value. Analyzed, but result is undetermined
ND	Non-detected
P	Bacti result, present

### QC Type

Code	Description
BLK	Method Blank Sample
CAL	Calibration Sample
CCV	Continuing Calibration Verification Sample
DUP	Duplicate Sample
ICV	Initial Calibration Verification Sample
LCS	Laboratory Control Standard Sample
LCSD	Laboratory Control Standard Duplicate Sample
MRL_CK	Method Reporting Level Check Sample
SPK	Matrix Spike Sample
SPKD	Matrix Spike Duplicate Sample

**Qualifiers Legend:**

**Flag**

<b>Code</b>	<b>Description</b>
A1	See case narrative, notes, or comments.
B1	Target analyte detected in associated Method Blank.
B2	Target analyte detected in Travel/Trip/Equipment Blank.
E1	Estimated value. Exceeds calibration range. Reanalysis not possible due to insufficient sample vol.
E2	Estimated value. Exceeds calibration range. Reanalysis not performed due to hold time requirement.
E3	EMPC (estimated maximum possible concentration)
H1	Sample analysis performed past the method specified hold time per client request.
H2	Initial analysis within hold time. Reanalysis for the required dilution was past hold time.
H3	Sample was received past hold time.
H4	Confirmatory analysis was past hold time.
H5	Confirmatory analysis was past hold time. Original result not confirmed.
H6	Filtration not completed within method specific time; Filtered in Lab. Filtration exceeded hold time.
I1	I.S. recovery or R.T. outside method limits. Interference confirmed by reanalysis/dilution. GC/GCMS
L1	LCS and/or LCSD is outside acceptance limits. Results might be low biased.
L2	LCS and/or LCSD is outside acceptance limits. Results might be high biased.
M	Matrix interference suspected.
M1	MS/MSD % rec. outside acceptable limits. Batch acceptance by LCS.
M2	MS/MSD RPD outside acceptable limits. Batch acceptance by LCS.
M3	Sample diluted due to matrix. MS recovery not useful. Batch acceptance by LCS.
NA	Not Analyzed
NC	Not for Compliance
NC1	Method specification(s) not met
NC2	Test/analyte is not accredited or accreditation is not available.
NP	Not provided
NS	Not sampled (or no sample received)
P1	Sample received and analyzed without chemical preservation.
P2	Sample received without chemical preservation but preserved by the laboratory.
P3	Sample received with inadequate chemical preservation, but preserved by the laboratory
P4	Sample was received outside recommended temperature range.
P5	Sample received in inappropriate sample container.
P6	Insufficient sample received to meet method requirements.
P7	Sample received with head space.
Q	%D (difference) between the 1st and 2nd column/detector is >50%. Lower value reported.
Q1	Minimum Reporting Limit (MRL) verification failed high, but target analyte was not detected.
R	Data rejected
S	Dilution due to sample matrix effects, the surrogate recovery was outside the acceptance limits.
S1	Sample diluted due to matrix. Surrogate spike recovery provides no useful information.
S2	Surrogate recovery below acceptable limits. Results might be low biased.
S3	Surrogate recovery exceeds acceptable limits. Results might be high biased.
TIC	Tentatively Identified Compound
U	Analyzed but not detected

**RQualifier**

<b>Code</b>	<b>Description</b>
+	Positive
-	Negative

#### Notes and Definitions

- P-02      Sample acidified to pH <2 and allowed to sit 24 hours before further processing.
- QM-4X     The spike recovery was outside of QC acceptance limits for the MS and/or MSD due to analyte concentration at 4 times or greater the spike concentration. The QC batch was accepted based on LCS and/or LCSD recoveries within the acceptance limits.
- R-01      The Reporting Limit for this analyte has been raised to account for matrix interference.
- T-14      Residual chlorine, dissolved oxygen, sulfite, and pH must be analyzed in the field to meet the EPA specified 15 minute hold time.
- ND        Analyte NOT DETECTED at or above the reporting limit
- dry        Sample results reported on a dry weight basis
- RPD       Relative Percent Difference

\* ELAP does not offer accreditation in this matrix for the requested analyte/method combination.

RE: SF Intrusion Project

Work Order: 23H2291

Enclosed are the results of analyses for samples received by the laboratory on 08/14/23 21:30. If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Robbie C. Phillips

Project Manager

#### Notes and Definitions

- QM-4X The spike recovery was outside of QC acceptance limits for the MS and/or MSD due to analyte concentration at 4 times or greater the spike concentration. The QC batch was accepted based on LCS and/or LCSD recoveries within the acceptance limits.
- R-01 The Reporting Limit for this analyte has been raised to account for matrix interference.
- S-02 The surrogate recovery for this sample cannot be accurately quantified due to interference from coeluting organic compounds present in the sample extract.
- T-14 Residual chlorine, dissolved oxygen, sulfite, and pH must be analyzed in the field to meet the EPA specified 15 minute hold time.
- ND Analyte NOT DETECTED at or above the reporting limit
- dry Sample results reported on a dry weight basis
- RPD Relative Percent Difference

\* ELAP does not offer accreditation in this matrix for the requested analyte/method combination.

**Appendix C**  
**Westside Basin Groundwater Monitoring Manual of Procedures**

---

---

# **Westside Basin Groundwater Monitoring Manual of Procedures**

---

**Final**

March 2014

## **Foreword**

---

The San Francisco Public Utilities Commission (SFPUC) has authorized two new groundwater projects to help meet the SFPUC's regular and dry year water supply needs. The San Francisco Groundwater Supply Project (SFGW) will provide a total of up to 4 mgd from 6 wells in San Francisco as a regular water supply to supplement the existing surface water supply in San Francisco. The Regional Groundwater Storage and Recovery (GSR) Project will pump up to 7.2 mgd from 16 wells in northern San Mateo County as a regional dry year water supply.

Over the past 15 years, the SFPUC has worked with the Daly City, San Bruno and Cal Water to develop a network of monitoring and test wells and a sampling program to characterize groundwater quality and water levels in the Westside Basin. This program allows basin users to monitor the long-term condition of the basin; helps establish baseline conditions prior to implementation of the SFPUC's projects; and will inform future basin operations.

This document outlines the technical procedures for the SFPUC groundwater sampling programs in the Westside Basin. The Water Quality Division (WQD) will complete sampling and coordination with the Water Resources Division (WRD) according to standards and programmatic details described in this manual. WRD will continue to provide groundwater project management, data analysis, and reporting.

This formal program description applies to routine monitoring and sampling. Additional monitoring Standard Operating Procedures (SOPs) for environmental assessments and remediation, environmental discharges for future drinking wells, and other special studies will require alternative sampling procedures. The SFPUC Water Quality Division would like to acknowledge and thank the following individuals who have contributed to this project:

SFPUC – Water Quality Division

Andrew DeGraca, P.E.  
Manouchehr Boozarpour, P.E.  
Alan R. Wong, P.E.  
Roberto V. Gonzales, P.G.

## **1.1. Overview**

The San Francisco Public Utilities Commission (SFPUC) has developed a groundwater monitoring program for the Westside Basin in support of its groundwater management goals and various planned groundwater projects. Monitoring of groundwater elevations and water quality is conducted to evaluate the potential for seawater intrusion, determine water quality and groundwater conditions in areas of potential groundwater development, define lake-aquifer interaction, assess general conditions in the Westside Basin resulting from historical and ongoing pumping, and establish baseline groundwater conditions prior to and during implementation of various groundwater projects.

This manual provides formal procedures and program descriptions of Westside Groundwater Basin monitoring for SFPUC staff involved with the sampling and field analytical measurement, as well as for the data analysis and reporting for the various groundwater programs. The manual does not, however, include any environmental assessment protocols that may affect groundwater quality. This information can be referenced from the latest Drinking Water Source Assessment Program documents for the proposed San Francisco Groundwater (SFGW) Project as well as the proposed Regional Groundwater Storage and Recovery (GSR) Project.

## **1.2. Background**

The Westside Basin is composed of a series of aquifers with its north boundary located in Golden Gate Park in San Francisco stretching to its southern boundary in the City of Burlingame in San Mateo County. The City of Daly City, California Water Service Company (Cal Water), and the City of San Bruno currently operate a series of wells that distribute groundwater from the Westside Basin to their respective systems. These entities also receive water from the SFPUC's Regional Water System.

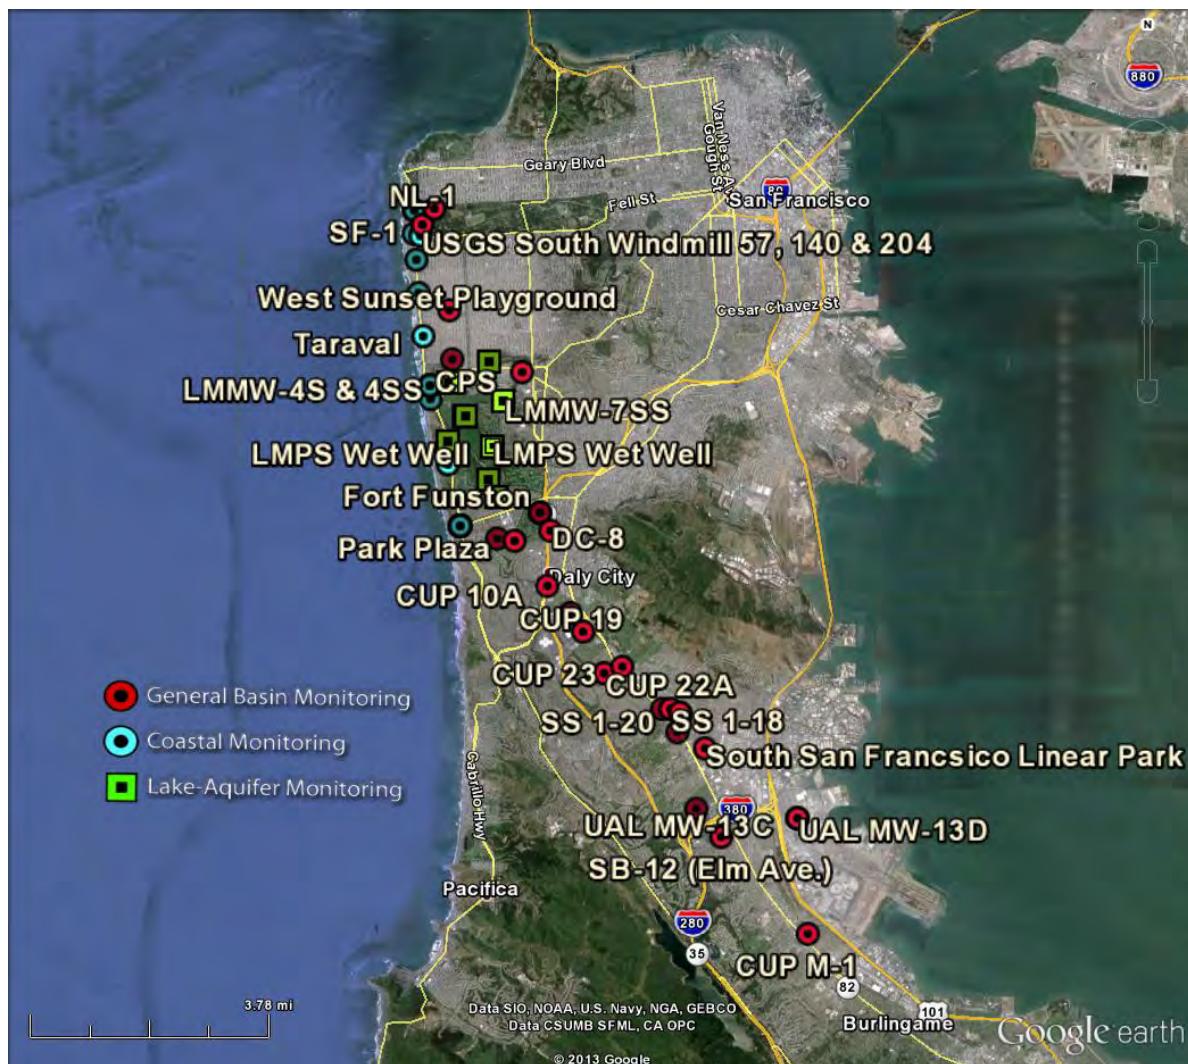

As with the agencies noted above, the SFPUC plans to supplement existing surface water supplies with groundwater. The SFGW project was developed to supply up to four million gallons per day (MGD) from the North Westside Basin from six production wells. These wells will be operated continuously in order to increase the long term availability of water in San Francisco. The GSR project was designed to supply up to 7.2 MGD of groundwater from the South Westside Basin during drought conditions.

In 2000, the San Mateo County Environmental Health Services Agency initiated the effort in sampling and testing groundwater conditions throughout the Westside Basin. In 2004, the program coordination was shifted to the SFPUC in cooperation with Daly City, San Bruno, and Cal Water (Partner Agencies). The SFPUC continues to lead the monitoring and sampling programs in the Westside Basin based on groundwater management goals and any supporting data needed for the SFGW and GSR projects.

Water quality and level sampling is currently handled by the Natural Resources Division (NRD) and an outside consulting firm with oversight and coordination by the Water Resources Division (WRD). The Water Quality Division will assume the role of sampling during fall of 2013. Water quality samples are processed through Millbrae Laboratories and select samples are sent to subcontracted laboratories for analysis.

All well locations are sampled from a network of existing monitoring and production wells located throughout the Westside Basin. A complete list of individual well sites and map locations can be found in Appendix F.

This document is not intended to cover monitoring procedures for any future potable water well facilities.

**Figure 1: Westside Basin Groundwater Well Location Overview**

### **1.3. Governing Regulations**

Groundwater regulations and guidance materials for the procedures listed in this manual were researched from available literature, web search of regulatory sites and through contact with the local California Department of Public Health. Existing practices already in use by Water Resources & Natural Resources Divisions and various consultants were also considered.

No specific regulations were identified governing monitoring well sample techniques, operations and maintenance. Most of the available guidelines were found from U.S. EPA, Region 9 (Western Region) and Region 4 Science, Ecosystem Support Division (SESD, Southeast Region based in Atlanta). The latter SESD document was dated 2013 and referenced several other research and guidance recommendations found online.

Summaries of key regulations and guidelines governing monitoring well sampling, operations and maintenance, sorted by agency, are as follows:

United States Environmental Protection Agency (U.S. EPA), Region 9 and Region 4. No regulations were found, however several guidance documents were published on sampling and operating procedure, well and depth measurement, decontamination and field equipment cleaning.

California Department of Water Resources (CA DWR). Published regulations for monitoring well construction, disinfection and destruction/abandonment in DWR Bulletin 74 and Bulletin 91. No specific regulations or guidance were found for operations, sampling or monitoring of wells. DWR permits monitoring wells, and construction data must be submitted to DWR and assigned a state well number.

California Regional Water Quality Control Board. Governs discharges to state water bodies and reinjection of water into the aquifer. No specific regulations or guidance were found for operations, sampling or monitoring of wells.

California Department of Public Health. Oversees drinking water regulations and statutes in California Code of Regulations Title 22. Regulations cite aquifer protection and prevention of groundwater contamination. No specific regulations or guidance found for operations, or sampling or monitoring of wells.

San Francisco Department of Public Health. Provides local jurisdiction of wells and enforces City and County of San Francisco regulations. Regulations in Article 12B of the San Francisco Health Code include language regarding prohibiting contamination of groundwater and well/boring construction and destruction requirements. No specific regulations or guidance were found for operations, sampling or monitoring of wells.

## **Project Objective**

The objective of this project is to create a Manual of Procedures (MOP) for the various groundwater sampling and monitoring programs for the Westside Basin. It includes details and descriptions for each monitoring program, locations for each well site, coordinates and direction data for each well, and standard operating procedures (SOPs) for water quality, water level sampling, and the various types of equipment used for groundwater sampling.

The basin monitoring programs are divided into five categories. The description for each category is as follows:

**Table 2.1-1: Well Monitoring Categories and Objectives**

<b>Category</b>	<b>Objective</b>
<b>General Basin Monitoring</b>	Hydrogeologic dynamics of groundwater conditions (levels)
<b>Coastal Monitoring</b>	Detection of seawater intrusion at coastal and bayside locations
<b>Lake-Aquifer Monitoring</b>	Characterization of lake-aquifer interactions around Lake Merced
<b>Groundwater Supply</b>	Assessment of groundwater conditions at proposed local and regional drinking water well locations
<b>Miscellaneous Projects</b>	Sampling support for all other groundwater-related projects (e.g. Contaminants of Emerging Concern (CEC) Study)

## **Well Locations and Descriptions**

Wells used for the various sampling protocols for the Westside Basin are located locally throughout Golden Gate Park, Sunset District, and Lake Merced, as well as in Daly City, Colma, South San Francisco, Millbrae, Burlingame, and San Bruno. These wells include various monitoring wells and existing wells developed by SFPUC and Partner Agencies along the Peninsula. Appendix A lists each well sampling location along with its associated physical parameters that may aid in the sampling process. These parameters include:

Well type  
Sample method  
Geospatial coordinates  
Location  
Water level from previous sampling event  
Case diameter  
Total depth of casing, below top of casing (BTOC)  
Measured total depth of casing, BTOC  
Screen interval  
Year Installed  
Additional comments (well condition, special access or location information)

Table 3.1-1 below tabulates typical sampling and analyses for well sites in the Westside Basin. Additional constituents are added on an as-needed basis.

**Table 3.1-1: Analyses and Associated Well Sites**

## Monitoring Schedule

A monitoring schedule has been implemented to accommodate the various sampling events throughout the calendar year. The program list includes Semi-Annual (water quality, level), Quarterly, Annual Production (Title 22 for various test/monitoring wells), Specific Sampling (repeat sampling for detected contaminants of concern), and Special Projects. Figure 2 shows the overall Basin monitoring schedule.

- Plan A - Quarterly Water Level Monitoring:** Water level measurements and downloading transducers (levelloggers and barologgers)
- Plan B - Semi-Annual Water Sampling and Water Level Monitoring:** Plan A activities and groundwater sampling for well specific constituents
- Plan C - Annual Water Sampling:** Groundwater sampling for full Title 22 constituents (test wells and regulatory wells)
- Plan D - Special Groundwater Sampling:** usually conducted with regular scheduled well sampling

**Figure 2: Groundwater Sampling and Monitoring Schedule**

## Staffing

WQD will maintain field sampling equipment, conduct field sampling, compile field sampling records, coordinate pick-up and drop-off of sample containers, and coordinate with WRD according to the standards and programmatic details described in this manual. WRD will provide project management, data analysis, and reporting.

A minimum of one engineer/scientist and one senior technician from WQD will be needed to conduct the field work for each sampling event. The engineer/ scientist will review & analyze data, reporting and program development. The scientist will manage equipment, scheduling, and preparation for sampling, and perform field work and analysis with assistance from the team.

**Note:** The field work component of the prior water sampling events required two full-time scientists from the Natural Resource Division (NRD) for two weeks for shallow well sampling and two full-time staff members from Baseline Environmental Consulting for two weeks for deep

well sampling. Coordination and program management by one scientist from WRD remains unchanged for the new program.

## **Major Equipment**

Westside Groundwater Basin monitoring and sampling requires mechanical and electrical equipment to measure water level and well depths, and extract water from the well. These equipment are sized to fit within the 2" diameter well casing, and needs to be securely fastened so that the equipment can be retrieved after measurement and sampling.

A multi-parameter field analyzer is needed to monitor the water quality during the purging process, where specific parameters are measured for stability and consistency.

Equipment is bulky and heavy and requires a large vehicle for transport. Operations, maintenance and safety protocols are provided in Appendix G. Key equipment are listed and briefly discussed below:

### **Level Tape and Reel**

Tape measures to 0.01 feet and is attached to a probe with an electrode sensor to detect water depth, with either a manual hand crank or automated reel. Westside Basin monitoring requires tape lengths of 500' to 750'. Tape should be decontaminated and cleaned between uses.

### **Well Pump**

Groundwater can be extracted from wells by hand bailers or pump-tubing systems. Pumps allow the sampler to purge standing well water and obtain fresh groundwater from the source aquifer. For the Westside Basin monitoring, two pump systems are used.

**Submersible Pump** – (e.g. Grundfos RediFlo2 electrical submersible pump, Portable Purge and Sampling Pump System, 100ml/min to 9gpm, 5.5lbs. 5HP. 220V 5.5amps; 1.8 in diameter). This multistage centrifugal pump provides a higher flow to purge shallow wells (280' or less), and provide continuous flow for sampling. Pump placement should be within the top 3 to 5' of the water surface so that the casing can be purged of at least 3 well casing volumes of water. The pump and tubing/ hose reel assembly is operated with a VFD flow controller. A stainless steel wireline cable is attached to the pump to ensure retrieval from well.

**Bladder Pump** – (e.g. Geotech bladder pump). This pump, equipped with small diameter tubing (1/4 in and 3/8 in OD) is used to sample deeper wells (up to 1000' depth), and provides continuous low flow (at 100 – 500 ml/min) for sampling. The pump operates with pressurized CO<sub>2</sub> gas to expand and compress the bladder to suction lift the sample to the surface. Gas does not come into contact with the sample. The pump fits within 2" diameter monitoring wells. Pump placement should be at mid-screen depth so that formation water is extracted directly from the target aquifer. Purging of water inside the sample tubing is required (to at least 3 tubing volumes). Other equipment used in conjunction with the bladder pump include: flow controller,

CO<sub>2</sub> cylinder with pressure regulator and stainless steel cable to ensure retrieval from the well.

**Other Pumps** – Other types of pumps include bailers, peristaltic pumps, and hydra-sleeves. A peristaltic pump may be used to purge and sample shallow wells (to about 25 feet). Also, it is used when decontaminating the tubing and pump.

#### **Tubing**

**Silicon Silicone Tubing** (1/2" ID, 5/8" OD, 300'). Stain, corrosion and ozone/UV resistant tubing used to purge and sample wells. Tubing is odorless and inert, but susceptible to high temperatures and should be replaced if gummy. NSF61 certified. For use with submersible pump.

**Polyethylene tubing** (1/4" ID, 3/8" OD, 1000')

**Teflon Tubing** (Teflon® and Silastic® or Tygon®, PTFE Type 1, Grade E5, 150 psi, ¼" OD x 0.040 wall and 3/8"OD x 0.062 wall/SS nuts and fittings or equivalent)

#### **Generator**

A gas generator is used to power the submersible pump. A Honda 2000i EU Inverter is available for use. This unit provides 2000 watts, 120V, 9.6 hours run time for 1 gal of gas. Weight: 47 lbs.

#### **Multi-parameter Water Quality instrument**

Field parameters such as pH, conductivity, DO, ORP, temperature and turbidity are measured and monitored when purging wells. Multi-parameter water quality meter used include: YSI 556, YSI Professional Plus, Horiba U-10, Hach MP-6, Hach 40-D, and Hach 2100P Turbidimeter. The multi-parameter meters are recommended for use with a flow-through cell unit.

#### **Leveloader**

Some of the wells are equipped with transducers/data loggers that continuously monitor water level and temperature. In particular, Solinst Leveloggers and Barologgers may be found suspended on a wire line cable or coaxial “direct read cables” inside the well. The table in Appendix A indicates the wells that currently have transducers and/or barologgers installed in them. Connecting the cable end of the data loggers to a Leveloader allows viewing of the data, downloading and/or programming in the field.

## **5.1 Groundwater Sampling Protocol**

This section describes general and specific procedures, methods and considerations to be used and observed in the collection and documentation of groundwater well data and groundwater samples for field screening and laboratory analysis, during its quarterly, semi-annual and annual schedules.

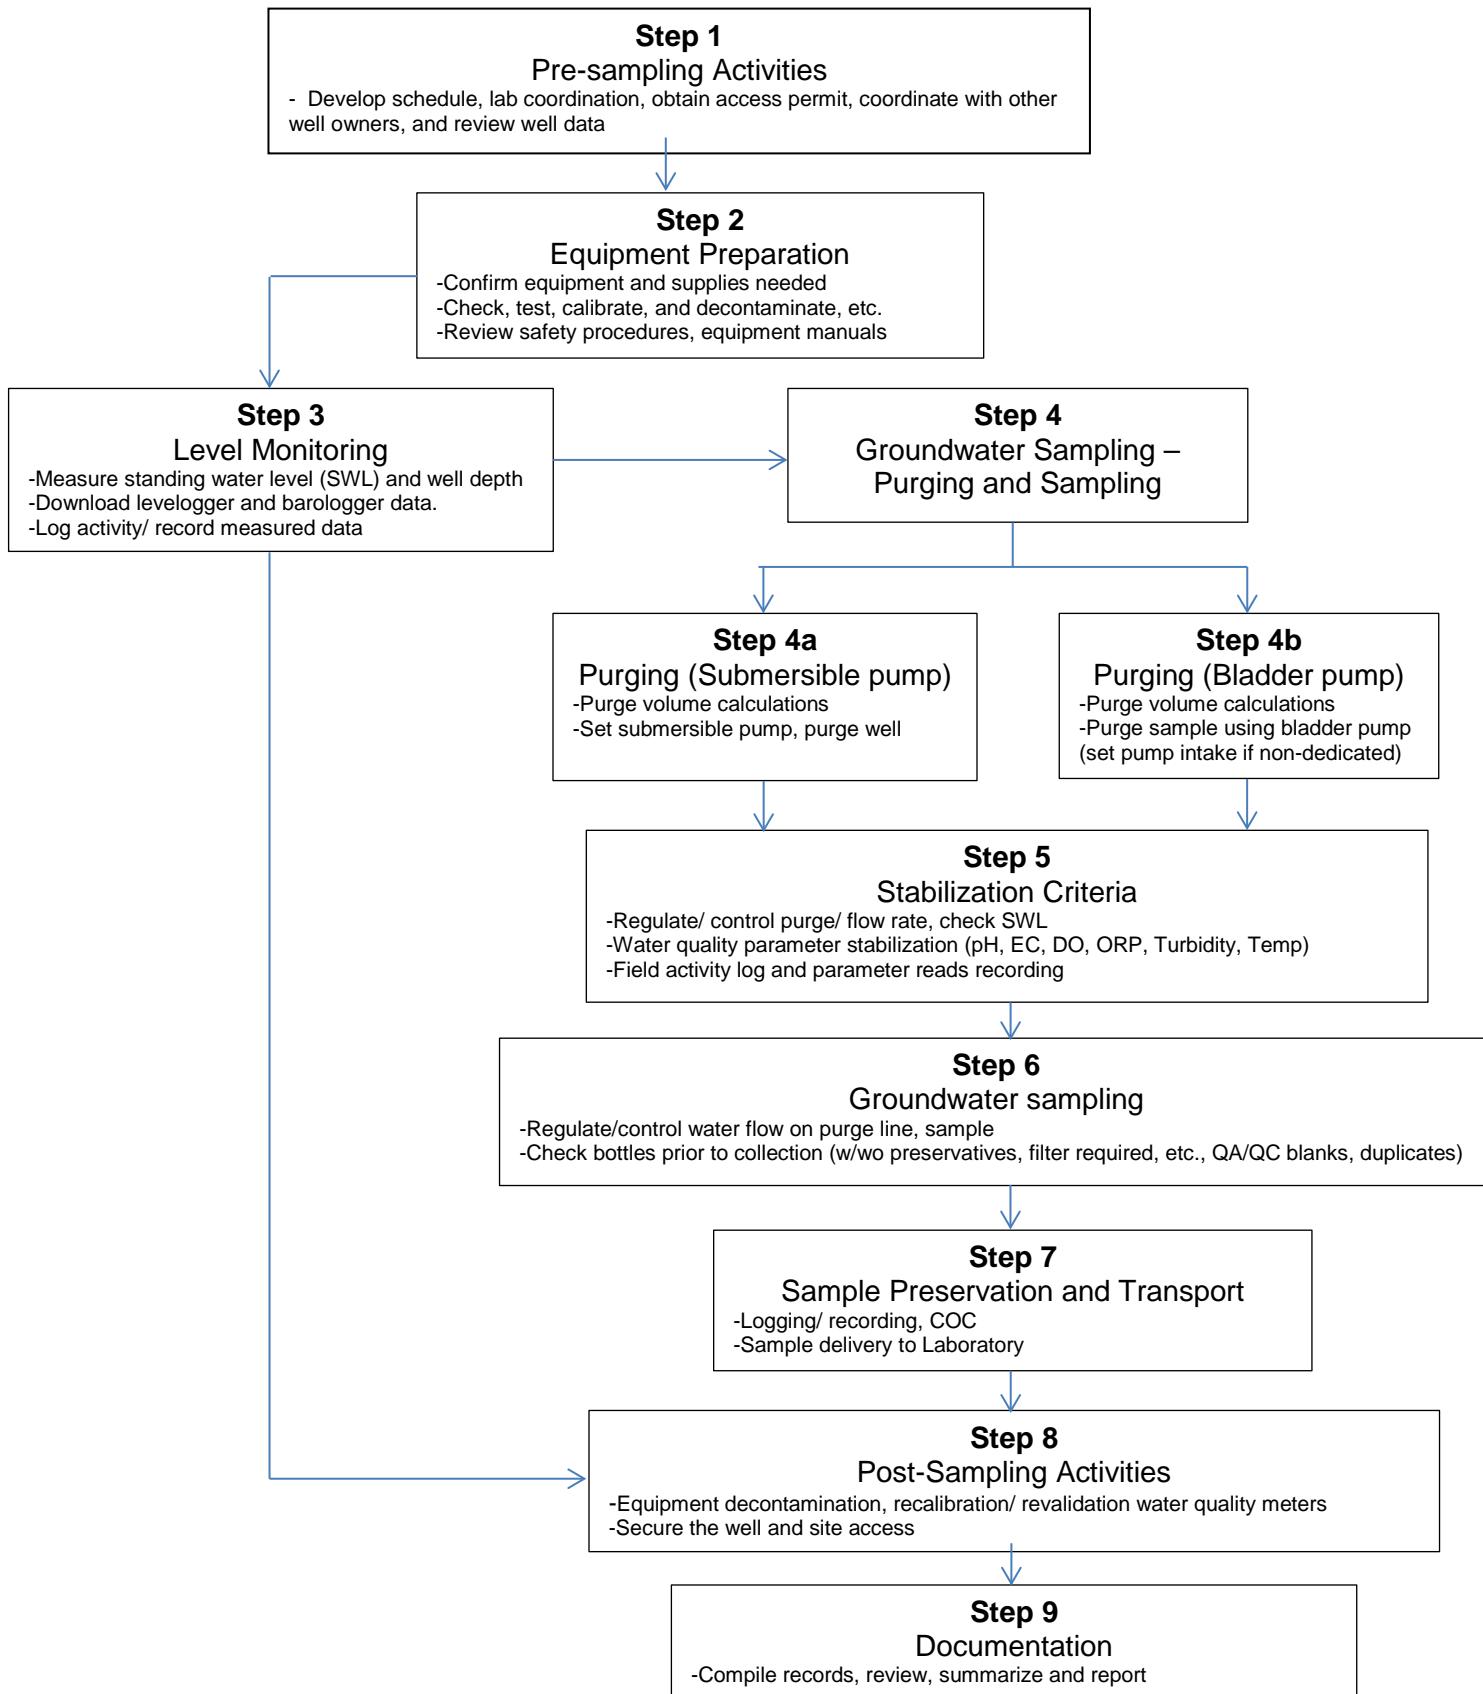

## **5.2 Monitoring and Sampling Overview**

The following list highlights key procedures when planning any groundwater monitoring and sampling activities:

- Determine monitoring/sampling schedule as calendared
- Determine and coordinate activity requirements (inter-agency services, e.g. access, sample bottles from the laboratory, and equipment)
- Understand field safety procedures, undergo training as necessary, and make available field safety equipment and PPE
- Know proper safety protocols when handling and operating field equipment and appurtenances
- Review well construction data and sampling history including purge stabilization data such as pump rates/ flow control adjustments, and water level data.
- Coordinate sampling event with Millbrae Laboratory. Providing type of sampling (e.g. regulatory Title 22, basin study), well and analyte lists, QA/QC samples (field, equipment and trip blanks, and duplicates needed), as well as transportation and receiving procedures and deadlines.
- Complete, check, calibrate, test and decontaminate monitoring and sampling equipment
- Understand and manage applicable purge method and water sampling practices
- Apply proper sampling protocol and field analytical techniques
- Know proper field activity logging, recording, chain-of-custody procedures, and reporting

## Section 5

# Groundwater Sampling Protocol

**Figure 3: Groundwater Monitoring and Sampling Flow Chart**

## Section 5

# Groundwater Sampling Protocol

**Table 5.2-1: Groundwater Monitoring and Sampling Plan Summary**

<u>Step(s)</u>	<u>Procedure</u>	<u>Materials/Equipment</u>
<b>Step 1 &amp; 2: Pre-sampling Activity/ Mobilization</b>	Determine monitoring/ sampling schedule. Review last well data (level, purging and sampling data), and safety protocols. Schedule field activities and lab requirements, coordinate well access/ permits Confirm schedule, goals, and analytes with groundwater project managers List and procure monitoring/sampling and safety equipment/ supplies (sample bottles, preservatives, filters, cooler, ice, etc.) Complete, clean, calibrate, test, check batteries, and decontaminate sampling equipment Site inspection	SOP manual, well sampling data from last monitoring event Equipment and supply list
<b>Step 3: Level Monitoring</b>	Open well cover and cap, note integrity. Clean and de-water if necessary Measure and record water level and well depth (reference point as marked/or north side of top of casing) Download data, if data loggers are present. Decontaminate submerged meter and probe Secure well if only doing level monitoring.	Set of keys, tools Water Level meter Levellogger Barologger Leveloader Field record sheets
<b>Step 4 &amp; 5: Well Purgung and Recording</b>	Install submersible pump or bladder pump to intake depth. Pump water to a minimum of 3x standing water volume. *If using bladder pump, purge a minimum of 3x line/tubing volumes as calculated. Regulate flow and monitor water quality parameters until stable: pH, EC, DO, ORP, Temperature, Turbidity. Refer to stabilization criteria Record water quality data and pump data	Submersible pump (lift range to 300 ft.) Generator Bladder pump (used with deeper wells and/or if dedicated tube is present) Water level meter Laptop
<b>Step 6: Sample Collection and Recording</b>	Regulate water flow, use sample purge line for sampling. Use filter only if required. Check sample bottles to use with type of analysis (w/ or w/o preservative), field blanks, standards. Water level meter re-validation/ calibration (last sampling site) Equipment decontamination (pump, hose and tubing in contact with groundwater). Complete COC	Field blanks (Travel & Equipment blank, if necessary) Sample labels Duplicate samples and bottles Field forms, COC
<b>Step 7: Sample Preservation, Storage and Transport</b>	Place samples in cooler and keep chilled during transport to the laboratory. Preservation includes cooling the sample to 4°C (40°F) during transport, shipping and storage. It is best to deliver the samples to the laboratory on the same day as sampling.	Cooler Ice packs and chemical preservatives (if necessary)
<b>Step 8: Post Sampling Activity</b>	WQ meter/ probe calibration/revalidation). Clean and pack equipment and supplies Brush/ clean inside casing protector (if necessary) and secure the well.	
<b>Step 9: Documentation</b>	Compile data and review results Summarize results for sampling/monitoring event and report	

## **Measurements of Groundwater Indicator Parameters**

Indicator parameters are measured in the field to evaluate well flow stabilization during purging, provide information on general ground water quality, and to help evaluate well construction, or indicate when well maintenance is needed. Indicator parameters measured during well purging and sampling activities include specific conductance, pH, dissolved oxygen, oxidation-reduction potential, turbidity and temperature. These are reliably measured using multi-parameter water quality meters, or a combination of available meters and probes. Calibration procedures vary with each meter. Hence, it is important to follow the operating instructions supplied for each piece of equipment.

Calibration of instruments should be conducted prior to each day of monitoring/ sampling activity. Although calibration is preferred to be done in the field as close to the time of use, it may be conducted in a controlled environment that is in the laboratory or field office. It is always a good practice to re-calibrate and validate all instruments used after the last sampling location to compare with the initial calibration results while noting any significant deviations.

### pH

Measurement of pH is conducted to determine the acid balance of the water on a scale of 1 (being strongly acid) to 14 (being strongly alkaline). It is ideally measured on site at the time of sampling.

### Conductivity

Conductivity is a measure of the ability of water to conduct electricity. This is directly related to the concentration of dissolved ions; thus, it is a reasonable indication of the concentration of dissolved solids in the water. Like pH, conductivity is ideally measured in the field.

### Temperature

Temperature is not necessarily an indicator of ground water chemical stabilization, and is generally not very sensitive in distinguishing between stagnant casing water and formation water. Nevertheless, temperature is important for data interpretation. Groundwater temperature is subject to rapid changes when collected for parameter measurement. Its usefulness is subject to question for the purpose of determining parameter stability. However, it is still advisable to record the sample temperature, along with the other groundwater chemistry parameters during well purging, as it may be needed to interpret other chemical parameter results in some situations.

**Dissolved Oxygen (DO)**

Dissolved oxygen (DO) has been noted to be a reliable indicator of the chemical stabilization of purge water under most ground water purging and sampling circumstances. DO is a good indicator when sampling for volatile organic compounds (VOCs), because erratic or elevated DO readings may reflect procedures that are causing excessive agitation and aeration of the ground water being drawn from the well and subsequent loss of VOCs. Artificially aerated ground water may also adversely affect dissolved metals analyses.

**Turbidity**

Turbidity is not an indicator of ground water chemical stabilization and does not distinguish between stagnant casing water and formation water. However, turbidity can be useful to measure during purging. Relatively high or erratic measurements may indicate improper sampling procedures, such as purging at an excessive rate that exceeds the well yield. Purging and sampling in a manner that produces low-turbidity water is particularly important when analyzing for total metals. When sampling for contaminants or parameters that may be biased by turbidity, stabilizing the turbidity readings at or below 10 Nephelometric Turbidity Units (NTUs) is recommended.

**Oxidation Reduction Potential Meter**

Oxidation-reduction potential (ORP), also referred to as redox potential or Eh, is a numerical index of the intensity of the oxidizing or reducing conditions within an aqueous solution such as groundwater. Oxidizing conditions are indicated by positive potentials and reducing conditions are indicated by negative potentials. ORP measurements are generally expressed in millivolts (mV).

## **Purge Stabilization Criteria**

An adequate purge is achieved when the pH and specific conductance of the ground water have stabilized, and the turbidity has either stabilized or is below 10 NTUs. Although 10 NTUs is normally considered the minimum goal for most ground water sampling objectives, lower turbidity has been shown to be easily achievable in most situations and reasonable attempts should be made to achieve these lower levels.

Stabilization occurs when, for at least three consecutive measurements, the pH remains constant within 0.1 Standard Unit (SU) and specific conductance varies no more than approximately 5 percent. Other parameters, such as dissolved oxygen (DO), may also be used as a purge adequacy parameter. Normal goals for DO are 0.2 mg/L or 10% saturation, whichever is greater. DO measurements must be conducted using either a flow-through cell or an over-topping cell to minimize or reduce any oxygenation of the sample during measurement. Oxidation Reduction Potential (ORP) should not be used as a purge stabilization parameter but

## Section 5 Groundwater Sampling Protocol

may be measured during purging to obtain the measurement of record for ORP for the sampling event (see Table 3 – Stabilization Criteria).

If the chemical parameters have not stabilized according to the above criteria after three well volumes have been removed, purging should continue up to five well volumes. If the parameters have not stabilized within five volumes, it is at the discretion of the project leader whether or not to collect a sample or to continue purging. If, after five well volumes, pH and conductivity have stabilized and the turbidity is still decreasing and approaching an acceptable level, additional purging should be considered to obtain the best sample possible, with respect to turbidity. The conditions of sampling should be noted in the field log.

**Table 5.4-1: Stabilization Criteria (Note: ORP is for reference only and not recommended for use to determine stabilization)**

Parameter	Stabilization Criteria
pH	± 0.1 standard units
Specific Conductance	± 5%
Oxidation-Reduction Potential (ORP)	± 10 millivolts
Turbidity	± 10% (when > 10 NTUs); maintained at <10 NTUs, consider stabilized
Dissolved Oxygen (DO)	± 0.2 milligrams per liter or 10% saturation; If 3 DO values<0.5 mg/L, consider stabilized

**Note:** Stabilization criteria based on U.S. EPA Groundwater Sampling Operating Procedure (Science and Ecosystem Support Division (SESD), SESDPROC-301-R3 section 3.2.1.1.2, effective March 6, 2013).

## **Procedural Precautions**

The following precautions should be considered when collecting groundwater samples:

- Avoid contaminating samples, start sampling from least suspected contaminated site.
- Always wear new clean sterile gloves per sample site, or as necessary.
- Always wash/spray wash the water level/depth level measuring probe and/or line, and pumping equipment with a phosphate free detergent (ex. Alconox), rinse with distilled or de-ionized water, and wipe clean each time it is used in a well. This minimizes the opportunity for cross-contamination to occur during sampling.
- Sample as soon as possible after purging
- Always document field events (e.g. well access, monitoring, purging and sampling procedural deviations) in a field logbook or appropriate field form.
- Chain-of-custody documents shall be filled out and remain with the samples until custody is relinquished.

## **Special Sampling Considerations**

### Volatile Organic Compounds (VOC) Analysis

Groundwater samples for VOC analysis are typically collected in 40 ml glass vials that are preserved with concentrated hydrochloric acid. Absolutely no bubbles or headspace should be present in the vial after it is capped.

After the cap is securely tightened, the vial should be inverted to see if any undetected bubbles are present. If a bubble or bubbles are present, the vial should be topped off with care so as not to flush any preservative out of the vial. If bubbles are still present after capping, a new vial should be obtained and the sample re-collected.

Groundwater producing large amount of fine bubbles will render the sample unacceptable. In this case, unpreserved vials should be used and arrangements must be made with the laboratory to meet the sample holding times.

**Note:** VOC analysis based on U.S. EPA Groundwater Sampling Operating Procedure (SESDPROC-301-R3 section 2.1, effective March 6, 2013).

### Sample Handling and Preservation Requirements

All sample vessels that do not contain preservatives should be rinsed twice with sample water. Groundwater samples will typically be collected from the discharge line of a pump. Reduce the flow from either the pump discharge line during sample collection to minimize sample agitation.

During sample collection, make sure that the pump discharge line does not come in contact with the sample container.

Samples may be collected from either designated tubing or reused tubing after purging decontamination.

Place the sample into appropriate, labeled containers. Samples collected for VOC, acidity and alkalinity analysis must **not** have any headspace. All other sample containers can be filled with headspace.

## **Quality Control**

To assure adequate QA/QC in the field, the sampling plan should be followed consistently. The laboratory typically provides the tools to verify if procedures are contaminating water samples, hence, a variety of samples and blanks need to be collected and analyzed. The following are typical checks:

**Field Duplicate** - Field duplicates are prepared by the laboratory to be collected at a frequency of one per sampling event (or one a day) or one (1) per 10 sampling locations. Field forms should note the wells from which field duplicates were collected.

**Trip Blanks** - Trip blanks are generally prepared by the laboratory and are included in each cooler containing VOC samples. At a minimum, at least one trip blank should accompany each sampling event. Trip blanks are never opened in the field.

**Equipment Blanks** - Whenever non-dedicated sampling equipment is used, equipment/field blanks should be collected. An equipment/field blank is obtained by passing analyte-free, distilled or deionized water through a cleaned sampling apparatus (pump, bailer, filtration gear, etc.) and collecting it in a clean container. This blank is used to assess the effectiveness of the decontamination procedures implemented between sampling locations.

Immediately after sampling, well data measurements shall be recorded in a field logbook or field monitoring/sampling form, and Chain-of-Custody documentation shall be completed.

## **Field Procedures**

### Accessing the Well

Monitoring wells are usually secured with a locking cover or bolted metal housing, either at ground level in well box or inside a 2- to 3- foot tall metal pipe housing. Inside the housing, the actual monitoring well (usually a 2- or 4-inch PVC pipe) is sealed with an expandable rubber plug that can be locked tight. The plug is sometimes sealed with a keyed padlock. Specific entities will need to be notified in order to access certain wells/properties and to schedule site work.

After completion of monitoring and sampling activities, all locking covers, locks, housing covers, and access gates should be secured safely to ensure protection of the well. Any maintenance or improvement needs should be recorded and reported to the supervisor and WRD.

### Level readings

Groundwater level and well depth measurements are needed to determine the volume of water or drawdown in the well casing for proper purging. These measurements also provide indication of the well condition.

All groundwater level and well depth measurements are made relative to an established reference point on the well casing documented in the field records. This reference point is usually identified by a permanent marker for PVC wells, or by a notch at the top of casing. By convention, this marking is usually placed on the north side of the top of casing. If no mark is apparent, the person performing the measurements should take both water level and depth measurements from the north side of the top of casing and note this procedure in the field logbook

Water levels should be allowed to equilibrate prior to measurement after removing sealing caps. When the sounding probe comes in contact with the water, the circuit is closed and a meter light and/or audible buzzer attached to the spool will signal contact. At least two readings are made. Measurements should be made and recorded to the nearest 0.01 foot.

The well sounder, a weighted tape or electronic water level indicators can be used to determine water level and the total well depth. Measuring well depth is accomplished by lowering the tape or cable until the weighted end is felt resting on the bottom of the well. The operator may find it easier to allow the weight to touch bottom and then detect the 'tug' on the tape while lifting the weight off the well bottom. Well depths do not need to be measured when we are only checking water levels (i.e., not sampling).

As a cautionary note, when measuring well depths with the electronic water level indicators, the person performing the measurement should initially check if the water level probe has its circuit closing electrode referenced to the tape distance markings and specific for water level

sounding. In some instances, one must measure and add the length of the probe beneath the circuit closing electrodes to the depth measured to obtain the true depth

**Note:** Level reading procedures based on U.S. EPA Groundwater Level and Well Depth Measurement Operating Procedure (SESDPROC-105-R2, effective January 29, 2013).

#### Data Loggers

Solinst Leveloggers and Barologgers may be found suspended on a wire line cable or coaxial “direct read cables” inside the well. The table in Appendix A indicates the wells that currently have transducers and/or barologgers installed in them. Additionally, prior to each water level measurement event, WRD will provide a list of water level measurements from the previous event; the list will also include a notation of which wells have transducers and/or barologgers installed in them. Connecting the cable end of the data loggers to a Laveloader allows viewing of the data, downloading and/or programming in the field. It is important to record the lapsed time real-time data logging was disturbed for later data interpretation.

After removing the data logging unit from the well, the water level is allowed to equilibrate/stabilize and is then measured using a water level sounder. After water level and depth measurements, purging and groundwater sampling are conducted the Levellogger and Barologger are placed back in the well as previously set.

#### Decontamination

Equipment and tools shall be kept cleaned and decontaminated throughout the groundwater sampling activities. Equipment in direct contact with groundwater such as water level meter tapes, probes, tubings, pumps, and protective sheaths will be new or decontaminated using at least the following process: Phosphate free soap (Alconox, Liquinox or equivalent) and water wash, and DI water rinse. Soap and DI water bath and sprays may be used for the process. Decontamination wastes such as rinsates, liquid spray, soil, nitrile gloves and other debris should be fully contained and collected for proper waste management and disposal.

**Note:** Decontamination procedures based on U.S. EPA Field Equipment Cleaning and Decontamination (SESD, SESDPROC-205-R2, effective December 20, 2011).

## Purging Requirements

Prior to sampling a monitoring well, the well must be purged to remove standing water from the well. Purging also serves to rinse and condition the sampling equipment with well water.

### Purge Volume Determination and Purge Adequacy

Prior to initiating the purge, the amount of water standing in the well should be determined. To do this, the diameter of the well/ casing must be determined and the water level and total depth of the well should be measured and recorded. Measuring the depth of a well indicates the amount of siltation that has occurred. Natural siltation can block water from entering, which could lead to erroneous water level measurements and bias analytical results by increasing sample turbidity. Checking depth also provides a check on casing integrity.

Once this information is obtained, calculate the approximate volume of water in the well using the following equation:

$$V = 0.041 \times d^2 \times h$$

Where:

$h$  = length of water column\* (ft)

$d$  = diameter of well (in)

$V$  = volume of water (gal)

\*The length of the water column ( $h$ ) is the total depth of the well minus the depth to water. Multiply the calculated volume ( $V$ ) by the desired number of well volumes to determine the purge volume, in gallons.

With respect to volume, an adequate purge is normally achieved when three to five well volumes have been removed. The field notes should reflect the single well volume calculation, and a reference to the appropriate multiplication of that volume, i.e., a minimum three well volumes, identified as a purge volume goal.

### Equipment Considerations for Purging

Monitoring well purging is accomplished by using in-place plumbing and dedicated pumps or by using portable pumps/equipment when dedicated systems are not present. The equipment utilized consists of a variable speed submersible pump and dedicated/ in-place bladder pumps. Standard operating procedures for these 2 methods are discussed in the following sections. In addition, the manufacturer's manual on operation, calibration and maintenance manuals for all groundwater monitoring and sampling equipment used by our crew are included in Appendix G.

Well Purging and Sampling Standard Operating Procedure

**Method 1 – Submersible Pump**

When a submersible pump, e.g. Grundfos RediFlo2, is used for well purging/ sampling, the pump itself is lowered into the water column. The pump/hose assembly used in purging should be lowered into the top of the standing water column, but not deep into the column. This is done so that the purging will "pull" water from the formation into the screened area of the well and up through the casing so that the entire static volume can be removed. If the pump is placed deep into the water column, the water above the pump may not be removed, and the subsequent samples may not be representative of the aquifer conditions. The pump should be lowered no more than three to five feet into the water column. If the recovery rate of the well is faster than the pump rate and no observable drawdown occurs, the pump should be raised until the intake is within one foot of the top of the water column for the duration of purging. If the pump rate exceeds the recovery rate of the well, the pump will have to be lowered, as needed, to accommodate the drawdown.

Before purging begins, prepare the necessary field forms. Review past well data, including pump depth placement and Variable Flow Drive (VFD) settings. Complete the field form including the type of equipment being used. Lay plastic sheeting around the well to prevent contaminating the equipment.

1. Using a water level meter, measure and record the depth to static/standing water level and the depth of the well inside the casing.
2. Calculate and record the well water volume (multiply by 3 to get purge volume).
3. In the monitoring well, lower the submersible pump followed by a water-level sensor to the desired location of the pump intake. Lower the equipment slowly and smoothly to avoid stirring up particulates. Position the pump intake between 3 ft (~0.9 m) below static water surface and a minimum distance above the top of the open/screened interval. The water-level sensor should be a maximum of 1 ft (~0.3 m) below water surface.
4. Start the generator. Connect the pump terminals to the generator, then run the pump using the VFD keypad controls. Gradually increase and (or) adjust the pumping rate to limit drawdown to between 0.5 and 1.0 ft (~0.15 to ~0.3 m). Measure the water level as purging progresses. The pumping rate for a pump can be determined by collecting the discharge from the pump in a bucket of known volume and timing how long it takes to fill the bucket. The pumping rate is recorded in gallons per minute.
5. If the final intake position is above the screened or open interval, the final pumping rate should be about 500 to 1,000 milliliters per minute. Do not exceed 1 ft of drawdown.
6. If the final intake position is within the screened or open interval, the final pumping rate should be about 200 to 500 milliliters per minute. Do not exceed 0.5 ft of drawdown. After approximately one to two well volumes are removed, a flow-through cell may be hooked-up to the discharge tubing of the pump.
7. If the pump and intake position are fixed, as in a supply well, control the rate of flow for field measurements through flow-splitting valve(s). Do not move the pump during

## Section 5

### Groundwater Sampling Protocol

- purging or sample collection after the intake has been set at the final location.
8. Throughout purging, monitor and record field-measurement readings. Check for special instructions regarding field-measurement or field-analysis requirements. Consult criteria for establishing field-measurement stabilization.
  9. Record field measurements at regular time intervals, about 3 to 5 minutes apart. For deep wells, the time intervals could be 15 minutes or longer. The time intervals selected will depend on the well characteristics and hydraulic properties of the aquifer, but the intervals must be sufficiently spaced to yield results representative of aquifer properties.
  10. Purge a minimum of three well volumes or the purge volume dictated by study.
  11. As the third or last well volume is purged, when the final field measurements are recorded, adjust the purge rate to the pumping rate to be used during sampling.
  12. If criteria are being met--record at least five sequential measurements and report the median value.
  13. If criteria are not being met, consult the study requirements and objectives. Extend the purge time if readings still do not stabilize; report the median value of the last five or more sequential measurements.
  14. Contain purge water as required by Federal, State, or local regulations.
  15. Complete field forms and report the data. Report the median of the recorded field-measurement readings as the final well volume is purged. Record anomalies, difficulties, and adjustments on the field form. Record the purge volume, rate of pumping, initial and final intake locations, and time and respective reading of sequential field measurements.
  16. Prepare the sample bottles and collect groundwater samples using the same purge tubing. Place bottles in coolers and add ice/ ice packs in sealed bags.
  17. Turn off pump, shut off generator. Slowly pull out the pump/hose assembly. Wipe dry the portion of the submerged hose and pump, and set up to decontaminate as per SOP (see section 5.8.4). Bag or wrap the pump with clean plastic prior to storage.

**Note:** Purging and sampling procedure based on U.S. EPA Groundwater Sampling Operating Procedure (SESDPROC-301-R3 section 3.3.1, effective March 6, 2013).

***Method 2 - Bladder Pump***

The following describes the purging and sampling procedures for the collection of ground-water samples when using a bladder pump. These procedures describe steps for both dedicated and non-dedicated systems. Some WSB monitoring wells have dedicated bladder pumps installed at set depths. Two surface tubing lines (air supply line and intake line) are required to hook up to the Micro Purge Basics Controller (Model MP-10 Controller).

Before purging begins, lay out plastic sheeting around the well to minimize the likelihood of contamination of sampling/purging equipment from the soil. Place monitoring, purging and sampling equipment on the sheeting.

1. Measure water level depth and well casing depth (to nearest 0.01 feet, and at least twice to confirm) relative to a reference measuring point on the well casing with an electronic water level indicator and record in logbook or ground-water sampling log.
2. Calculate the volume of the water inside the tubing that extends from the top of the monitoring well to the depth of the intake.
3. For a dedicated system – The pump (a QED P1101M bladder pump) has already been installed. Refer to the available monitoring well data from the last purge/ sampling and enter pertinent information into the new blank form (Baseline Environmental Consulting Groundwater Sampling Form). Note purge data, including pump intake depth, purge volume and (MP-10) controller settings
4. For a non-dedicated system - Place the pump and support equipment at the wellhead and slowly lower the pump and tubing down into the monitoring well until the location of the pump intake is set at a pre-determined location within the screen interval. The placement of the pump intake should be positioned with a calibrated sampling pump hose, sounded with a weighted-tape, or using a pre-measured hose. Measure the depth of the pump intake while lowering the pump into location. Record pump location in a field logbook or sampling log.
5. For both non-dedicated system and dedicated systems, the following procedure applies - Measure the water level and record information on the ground-water sampling log, leave water level indicator probe in the monitoring well.
6. For both non-dedicated and dedicated systems - Connect the discharge line from the pump to a flow-through cell. A "T" connection is recommended prior to the flow cell to allow for the collection of water for the turbidity measurements. The discharge line from the flow-through cell must be directed to a container to contain the purge water during the purging and sampling of the monitoring well.

## Section 5

### Groundwater Sampling Protocol

7. Non-dedicated and dedicated system – Connect all tubing/ fittings to air supply and pump to controller. Set air supply pressure (max 125 psi), set cycle and discharge values, set air intake psi and cycle frequency in the MP-10 Controller. Turn on pump and throttle/ adjust refill and discharge flow rates. Start pumping the well at a low flow rate (0.2 to 0.5 liter per minute) and slowly increase the speed. Check water level. Maintain a steady flow rate while maintaining a drawdown of less than 0.33 feet. If drawdown is greater than 0.33 feet lower the flow rate. Measure the discharge rate of the pump with a graduated cylinder and a stop watch. Also, measure the water level and record both flow rate and water level on the groundwater sampling log.
8. Non-dedicated and dedicated system - Continue purging, monitor and record water level and pump rate every three to five minutes during purging. Pumping rates should be kept at minimal flow to ensure minimal drawdown in the monitoring well.
9. Non-dedicated and dedicated system - During the purging, a minimum of one tubing volume (including the volume of water in the pump and flow cell) must be purged prior to recording the water-quality indicator parameters. Then monitor and record the water-quality indicator parameters every three to five minutes.
10. Once the criteria have been successfully met indicating that the water quality indicator parameters have stabilized, then sample collection can take place. If two tubing volumes (including the volume of water in the pump and flow cell) have been removed during purging then sampling can proceed. All information should be noted in the field notebook and groundwater sampling form with an explanation if a different purging and sampling procedure was conducted.
11. Prepare the sample bottles and collect groundwater samples using the same purge tubing. Place bottles in coolers and add ice/ ice packs in sealed bags.
12. After sampling, recording and properly storing the samples, turn off pump and air supply, and disconnect fittings. In a non-dedicated system slowly pull out/ remove the pump and tubing assembly from the monitoring well. Decontaminate the pump and tubing.
13. For a dedicated system, disconnect all surface tubing that extends from the plate at the wellhead (or cap). Rinse, bag and seal for future use in the same well. Also, decontaminate the tubing if to be used in other wells.

**Note:** Purgung and sampling procedure based on U.S. EPA Groundwater Sampling Operating Procedure (SESDPROC-301-R3 section 3.3.2, effective March 6, 2013).

## **Sampling for Laboratory Analysis**

For monitoring wells, the same pump should be used for purging and sampling without stopping or removing the pump. Samples should be collected directly from the discharge port of the pump tubing prior to passing through the flow-through cell. Alternatively, disconnect the pump's tubing from the flow-through-cell so that the samples are collected from the pump's discharge tubing.

The sequence of the samples is immaterial unless filtered (dissolved) samples are collected and they must be collected last. However, the preferred order of sampling is metals first, followed by other inorganic analytes, extractable organic compounds and volatile organic compounds. All sample containers should be filled with minimal turbulence by allowing the ground water to flow from the tubing gently down the inside of the container.

Access to production wells can be more difficult. Ideally, sample water should be collected directly from the well. A sample valve or spigot will be located in the water pipeline at a point in the distribution system that comes before the water enters any treatment and as close to the well as possible. In some cases it may be possible to gain access to the well casing through an access pipe. If you are sampling directly from a production well by means of a portable submersible pump, considerable care must be taken to avoid tangling or wedging the sampling/testing equipment between the production line, cables, and other equipment typically suspended in a well casing.

## **Documentation and Field Forms**

As mentioned previously, all field documentation should be accurately recorded. Accurate records are critical for historical purposes, including regulatory and liability issues. Appendix E lists all field forms related to all groundwater sampling activities.

We have two (2) level monitoring and groundwater sampling forms adapted from previous works: (1) the SFPUC Groundwater Level Data Field Form which is used for level monitoring survey only, and (2) the Groundwater Sampling Form, which includes more well data than the SFPUC Well Sampling Form used when purging/ sampling with the Grundfos submersible pump. This second form is adapted from Baseline Environmental Consulting for continuity. Because it is available in an electronic program, it is easier to determine when purge stabilization has been achieved. It is necessary to review and copy previous data for reference and guidance in setting flow controls for purging, sampling, and recording. Additional information or issues such as well/site condition and maintenance requirements should be recorded in the comments section.

A Field Daily Activity Log is kept on site and updated with all activities and events. The form is self-explanatory and is completed by filling in the box items such as changes from plans and procedures, important decisions made pertaining to water level monitoring, purging and

## Section 5

### Groundwater Sampling Protocol

sampling, weather conditions, visitors on site, notes on well site number, sample number/ label collected, QA/QC field duplicates collected, personnel on site, etc.

Chain-of-Custody (COC) forms are provided with the sample bottles by the laboratory and accompany the samples collected at all times. The forms are updated as soon as samples have been collected, checked and stored, prior to moving to the next sampling site or finally transporting and submitting all samples to the laboratory.
